1. Introduction

The GC9107 is a 262,144-color single-chip SOC driver for a-TFT liquid crystal display with resolution of 128RGBx160dots, comprising a 384-channel source driver, a 160-channel gate driver, 46,080 bytes GRAM for graphic display data of 128RGBx160 dots, and power supply circuit.

The GC9107 supports parallel 8-bit data bus MCU interface, and 3-/4-line serial peripheral interface (SPI). The moving picture area can be specified in internal GRAM by window address function. The specified window area can be updated selectively, so that moving picture can be displayed simultaneously independent of still picture area.

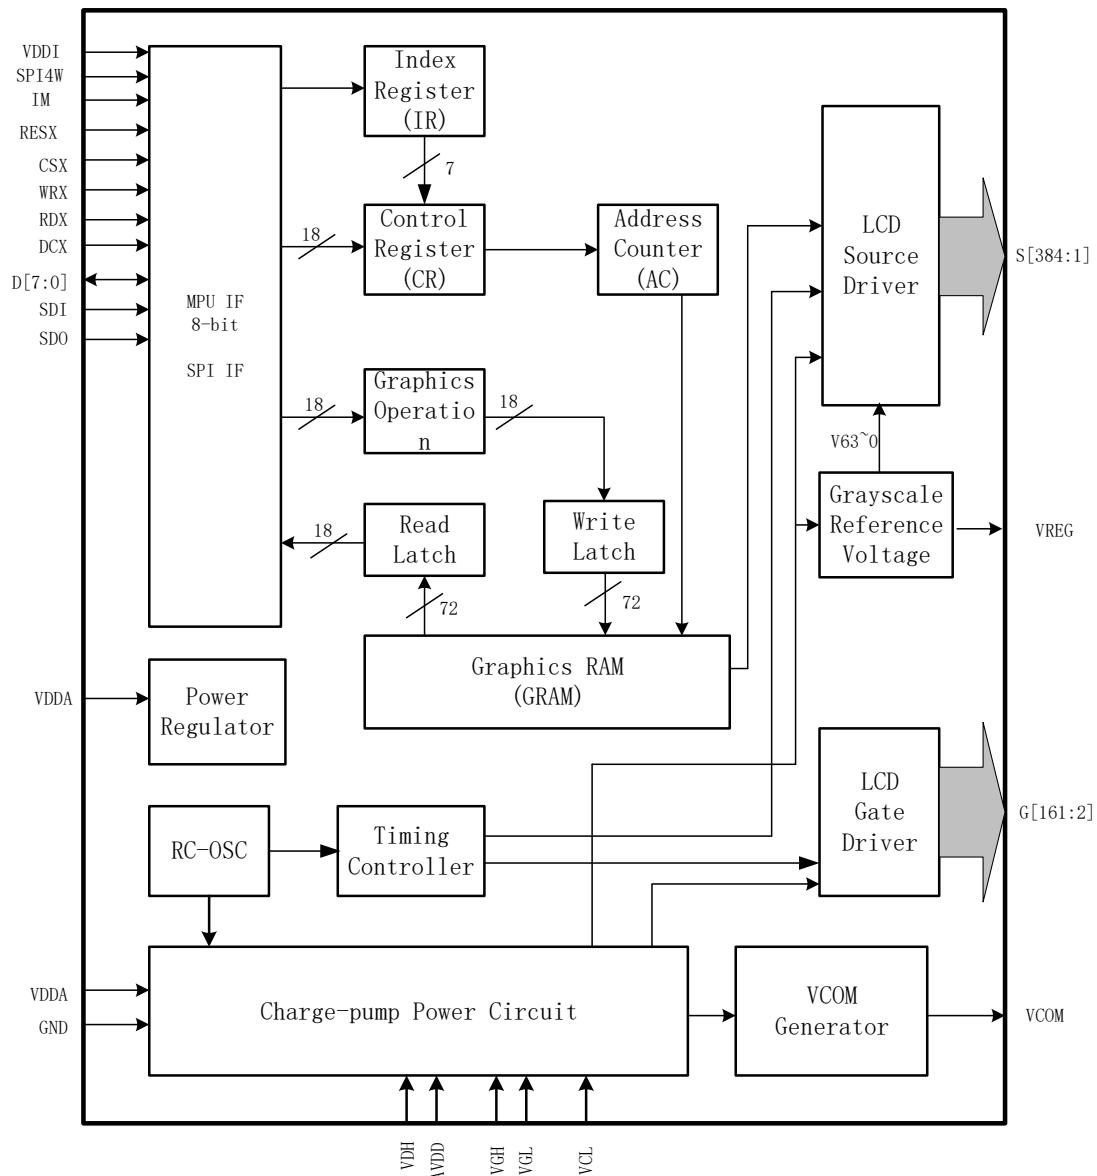

The GC9107 can operate with 1.65V ~ 3.3V I/O interface voltage and an incorporated voltage follower circuit to generate voltage levels for driving an LCD. GC9107 supports full color, 8-color display mode and sleep mode for precise power control by software and these features make the GC9107 an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, MP3 and PMP where long battery life is a major concern.

2. Features

- ◆ No need for external electronic component.
- ◆ Display resolution: [128xRGB](H) x 160(V)
- ◆ Output:
 - ✧ 384 source outputs
 - ✧ 160 gate outputs
 - ✧ Common electrode output (VCOM)
- ◆ a-TFT LCD driver with on-chip full display RAM: 46,080 bytes
- ◆ System Interface
 - ✧ 8-bits interface with 8080 MCU
 - ✧ 3-line / 4-line serial interface
- ◆ Driving Algorithm Support
 - ✧ Row Inversion
 - ✧ Frame Inversion
- ◆ Display mode:
 - ✧ Full color mode (Idle mode OFF): 262K-color
 - ✧ Reduce color mode (Idle mode ON): 8-color
- ◆ Power saving mode:
 - ✧ 8-color mode
 - ✧ Standby mode
- ◆ On chip functions:
 - ✧ Timing generator
 - ✧ Oscillator
 - ✧ DC/DC converter
- ◆ Support partial display
- ◆ Window address function to specify a rectangular area for internal GRAM access
- ◆ Low -power consumption architecture
 - ✧ Low operating power supplies:
 - IOVCC = 1.65V ~ 3.3V (logic)
 - VCI = 2.5V ~ 3.3V (analog)
- ◆ On-Chip Power System
 - ✧ Source Voltage(VREG): +2.92V ~ +5.19V
 - ✧ VCOM level(VCOMH、VCOML): +3.08V ~ +4.50V、-2.50V ~ 0V
 - ✧ Gate driver HIGH level (VGH): +10V ~ +15V
 - ✧ Gate driver LOW level (VGL): -13V ~ -7.5V
- ◆ Operate temperature range: -40°C to 80°C
- ◆ a-Si TFT LCD storage capacitor : Cst on Common structure only
- ◆ Package COG

3. Block Diagram

3.1. Block diagram

3.2. Pin descriptions

Power Supply Pins			
Pin Name	I/O	Type	Descriptions
VDDA (VCI)	I	Power	Power supply for analog, digital system and booster circuit
VDDI(IOVCC)	I	Power	Low voltage power supply for interface logic circuits(1.65~3.3V)
VSSA	I	Analog Ground	System ground level for analog circuit blocks
VSSR	I	Digital Ground	System ground level for logic circuit blocks

Interface Logic Signals			
Pin Name	I/O	Type	Descriptions
IM	I	(VDDI/VSSR)	MCU Parallel interface bus and Serial interface select - IM='1';Parallel-8bit Interface - IM='0';Serial Interface
SPI4W	I	(VDDI/VSSR)	SPI interface selection pin SPI4W='0': 3-wire SPI. (default) SPI4W='1': 4-wire SPI. This pin is internal pull low.
RESX	I	MCU (VDDI/VSSR)	This signal will reset the device and must be applied to properly initialize the chip. Signal is active low.
CSX	I	MCU (VDDI/VSSR)	Chip select input pin ("Low" enable). This pin can be permanently fixed "Low" in MPU interface mode only. *note1,2
DCX (SCL)	I	MCU (VDDI/VSSR)	This pin is used to select "Data or Command" in the parallel interface. When DCX='1', data is selected. When DCX='0', command is selected. This pin is used serial interface clock in 3-wire 9-bit/4-write 8-bit serial data interface. If not used, this pin should be connected to VDDI or VSSR.
RDX	I	MCU (VDDI/VSSR)	8080 system (RDX): Serves as a read signal and MCU read data at the rising edge.
WRX (RS)	I	MCU (VDDI/VSSR)	8080 system (WRX): Serves as a write signal and writes data at the rising edge. 4-write 8-bit serial data interface: serves as RS(data/command selection). Fix to VDDI level when not in use

GC9107 Datasheet

D[7:1] D0/SDA	I/O	MCU (VDDI/VSSR)	8-bit parallel bi-directional data bus for MCU system and D0 is also the serial input/output signal in SPI interface mode. Fix to VSSR level when not in use				
GM[1:0]	I	(VDDI/VSSR)	Panel Resolution selection pins				
			GM1	GM0	Resolution	Source gate	Window set (2ah 2bh)
			0	0	128X128	S1-S384, G2-G129	(0x00,0x7f) (0x00,0x7f)
			0	1	128X128	S1-S384, G2-G129	(0x00,0x83) (0x00,0x83)
			0	1	128X128	S1-S384, G2-G129	(0x02,0x81) (0x01,0x80)
			1	0	128X160	S1-S384, G2-G161	(0x00,0x83) (0x00,0xa1)
			1	0	128X160	S1-S384, G2-G161	(0x02,0x81) (0x01,0xa0)
			1	1	128X160	S1-S384, G2-G161	(0x00,0x7f) (0x00,0x9f)
TE	O	MCU (VDDI/VSSR)	Tearing effect output pin to synchronize MPU to frame writing, activated by S/W command. When this pin is not activated, this pin is low. If not used, open this pin.				

Note.

- If CSX is connected to VSSR in Parallel interface mode, there will be no abnormal visible effect to the display module. Also there will be no restriction on using the Parallel Read/Write protocols, Power On/Off Sequences or other functions. Furthermore there will be no influence to the Power Consumption of the display module.
- When CSX='1', there is no influence to the parallel and serial interface.

LCD Driver Input/Output Pins			
Pin Name	I/O	Type	Descriptions
S384~S1	O	Source	Source output signals.. Leave the pin to open when not in use.
G161~G2	O	Gate	Gate output signals. Leave the pin to open when not in use.
AVDD	O	OPEN	Power pad for analog circuit, A power supply pin for generating VREG
VGH	O	Power	Power supply for the gate driver. Adjust the VGH level with the VGHS[2:0] bits.
VGL	O	Power	Power supply for the gate driver. Adjust the VGL level with the VGLS[2:0] bits.

GC9107 Datasheet

VCL	O	Power	Power supply for VCOML. VCL=0~-VDD
VREG_TEST	O	OPEN	High reference voltage for grayscale voltage generator. Internal register can be used to adjust the voltage.
VCOM	O	Power	Power supply pad for the TFT-display counter electrode. Connect this pad to the TFT-display counter electrode.

Test Pins			
Pin Name	I/O	Type	Descriptions
TEST	O	Open	These test pins for driver vender test used Please leave these pins open
OSC_IN	I	Open	These test pins for driver vender test used Please leave these pins open
OSC_TEST	O	Open	These test pins for driver vender test used Please leave these pins open
VREF2P0_TEST	O	Open	These test pins for driver vender test used Please leave this pin open
DUMMY	-	Open	These pins are dummy. During normal operation, leave these pads open.

Liquid crystal power supply specifications Table

No.	Item	Description
1	TFT Source Driver	384 pins (128*RGB)
2	TFT Gate Driver	160pins
3	TFT Display's Capacitor Structure	Cst structure only (Cs on Common)
4	Liquid Crystal Drive Output	S1~S384 V0~V63 grayscales
		G2~G161 VGH-VGL
		VCOM -2.50V ~ +4.50V
5	Input Voltage	IOVCC +1.65V ~ +3.30V
		VCI +2.50V ~ +3.30V
6	Liquid Crystal Drive Voltages	VCOMH +3.08V ~ +4.50V
		VCOML -2.50V ~ 0V
		VGH +10.00V ~ +15.00V
		VGL -13.00V ~ -7.50V

4. Interface setting

4.1. MCU interfaces

GC9107 provides the 8-bit parallel system interface for 8080, and 3-/4-line serial system interface for serial data input. The input system interface is selected by external pins IM [2] and the bit formal per pixel color order is selected by IFPF [2:0] bits of 3Ah register.

4.1.1. MCU interface selection

The selection of interface is done by setting external pins SPI4W, IM, as shown in the following table.

SPI4W	IM	MCU-Interface Mode	Pins in use	
			Register/Content	GRAM
X	1	8080 MCU 8-bit bus interface	D[7:0]	D[7:0],WRX,RDX,CSX,D/CX
0	0	serial interface 3 line		SCL,SDA,CSX
1	0	serial interface 4 line		SCL,SDA,CSX,RS

4.1.2. 8080 Series Parallel Interface

GC9107 can be accessed via 8-bit MCU 8080 series parallel interface. The chip select CSX (active low) is used to enable or disable GC9107 chip. The RESX (active low) is an external reset signal. WRX is the parallel data write strobe, RDX is the parallel data read strobe and D [7:0] is parallel data bus.

GC9107 latches the input data at the rising edge of WRX signal. The D/CX is the signal of data/command selection. When D/CX='1', D [7:0] bits are display RAM data or command's parameters. When D/CX='0', D [7:0] bits are commands.

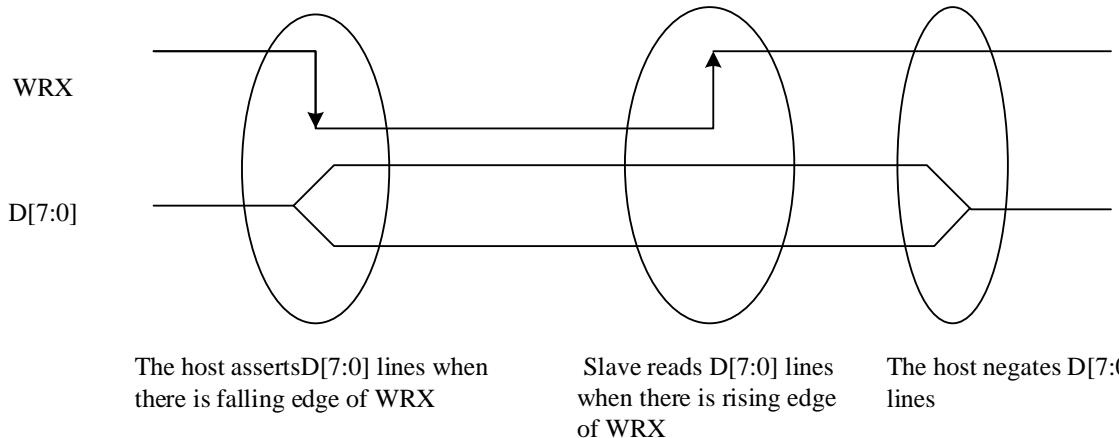

The 8080 series bi-directional interface can be used for communication between the MCU controller and LCD driver chip. The 8080 Interface selection is done when P68 pin is low state (VSSR level). The selection of 8080 series parallel interface is shown as the table in the following.

SPI4W	IM	MPU-interface	CSX	WRX	RDX	D/CX	Function
X	1	8-bit parallel	“L”	↑	“H”	“L”	Write command code.
			“L”	“H”	↑	“H”	Read internal status.
			“L”	↑	“H”	“H”	Write parameter or display data.
			“L”	“H”	↑	“H”	Reads parameter or display data.

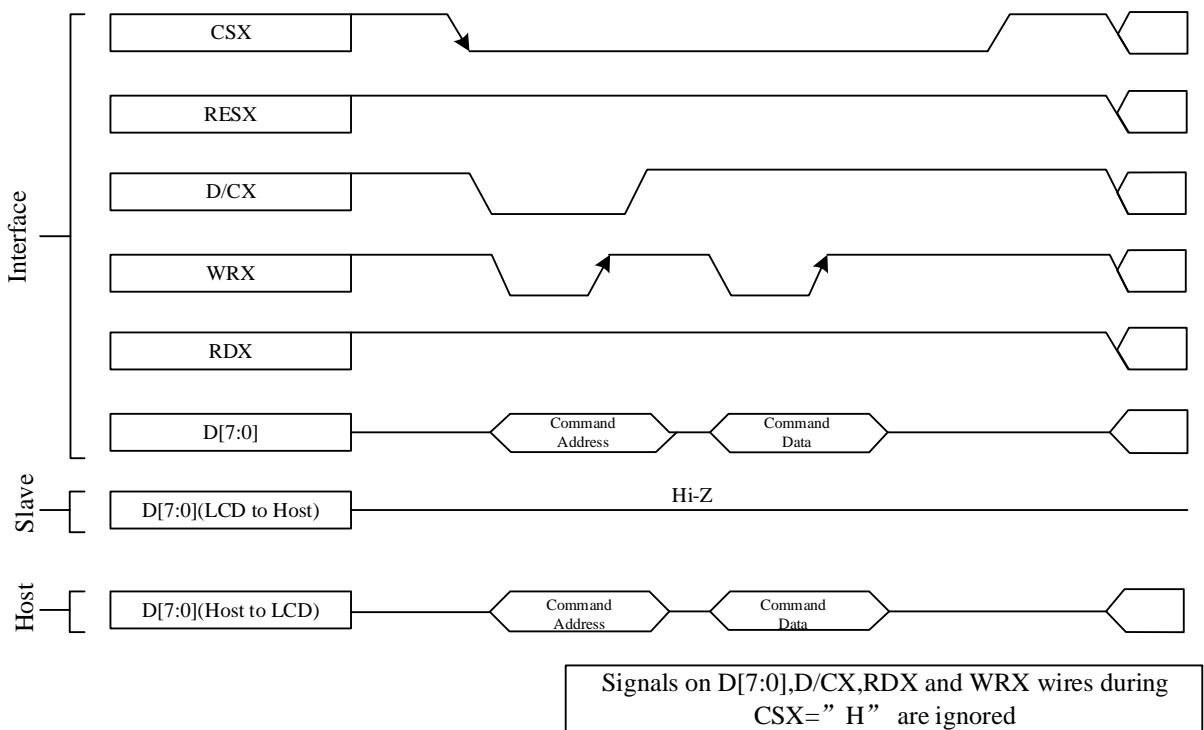

4.1.3. Write Cycle Sequence

The WRX signal is driven from high to low and then be pulled back to high during the write cycle. The host processor provides information during the write cycle when the display module captures the information from host processor on the rising edge of WRX. When the D/CX signal is driven to low level, then input data on the interface is interpreted as command information. The D/CX signal also can be pulled high level when the data on the interface is RAM data or command's parameter.

The following figure shows a write cycle for the 8080 MCU interface.

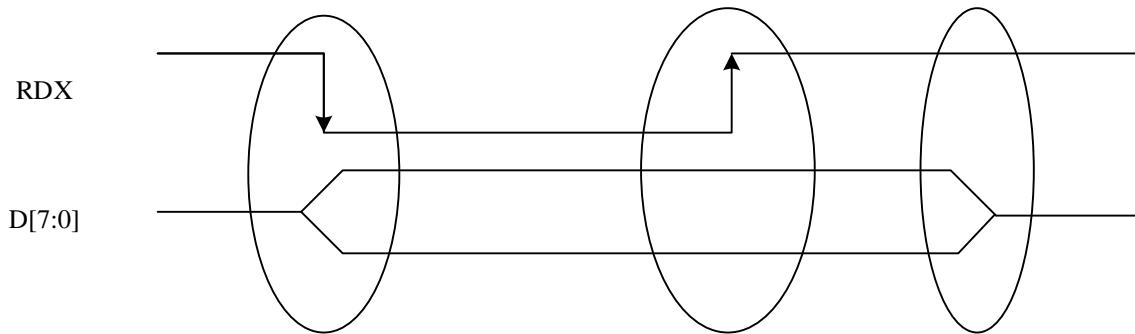

Note: WRX is an unsynchronized signal (It can be stopped)

4.1.4. Read Cycle Sequence

The RDX signal is driven from high to low and then allowed to be pulled back to high during the read cycle. The display module provides information to the host processor during the read cycle while the host processor reads the display module information on the rising edge of RDX signal. When the D/CX signal is driven to low level, then input data on the interface is interpreted as command. The D/CX signal also can be pulled high level when the data on the interface is RAM data or command parameter.

The following figure shows the read cycle for the 8080 MCU interface.

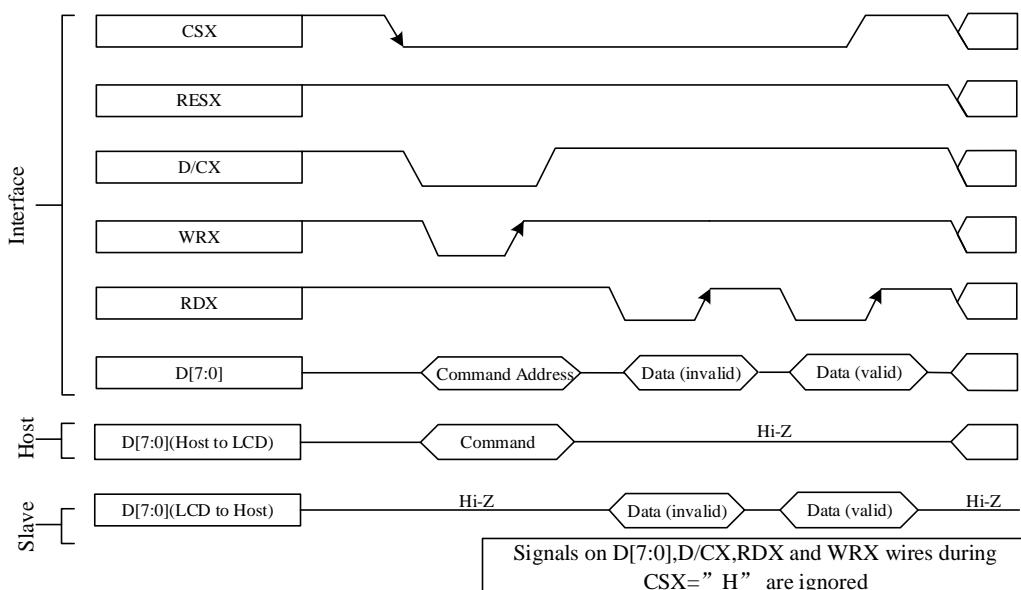

Slave asserts D[7:0] lines when there is a falling edge of RDX

The host reads D[7:0] lines when there is a rising edge of RDX

The slave negates D[7:0] lines

Note: RDX is an unsynchronized signal (It can be stopped).

Note: Read data is only valid when the D/CX input is pulled high. If D/CX is driven low during read then the display information outputs will be High-Z.

4.1.5. Serial Interface

The selection of interface is done by IM bit. Please refer to the Table in the following.

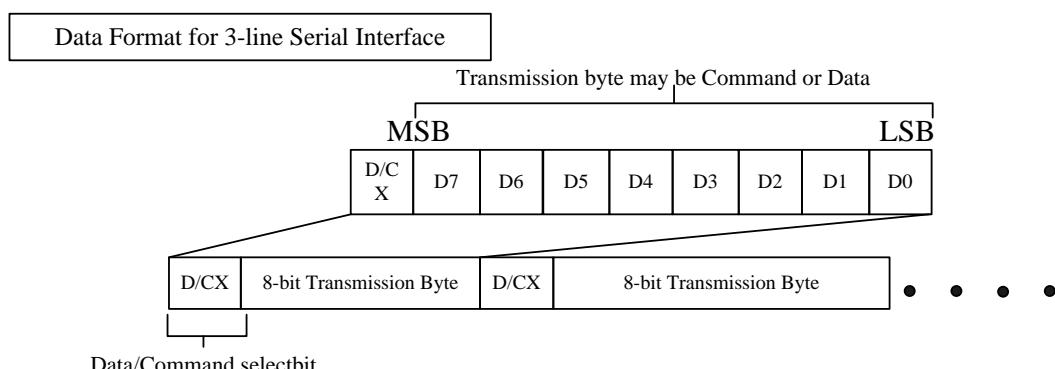

IM	SPI4W	MCU-Interface Mode	CSX	D/CX	SCL	Function
0	0	3-line serial interface	"L"	-	↑	Read/Write command, parameter or display data.
0	1	4-line serial interface	"L"	"H/L"	↑	Read/Write command, parameter or display data.

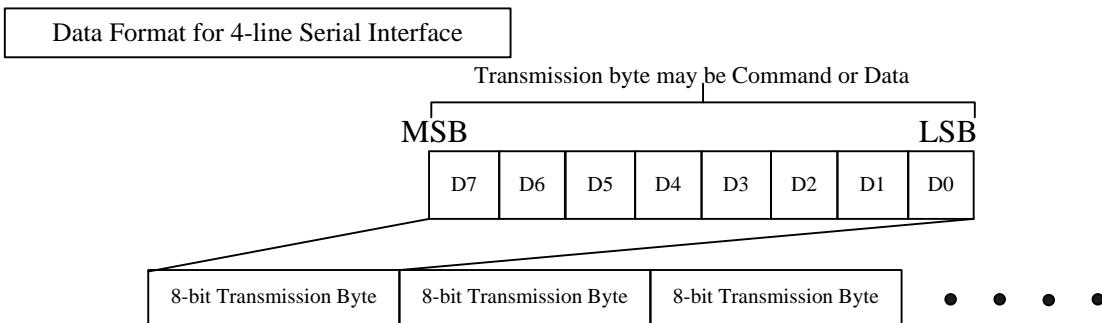

GC9107 supplies 3-lines/ 9-bit and 4-line/8-bit bi-directional serial interfaces for communication between host and GC9107. The 3-line serial mode consists of the chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (D0/SDA). The 4-line serial mode consists of the Data/Command selection input (D/CX), chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (D0/SDA) for data transmission. The data bus (D [7:1]), which are not used, must be connected to GND. Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

4.1.6. Write Cycle Sequence

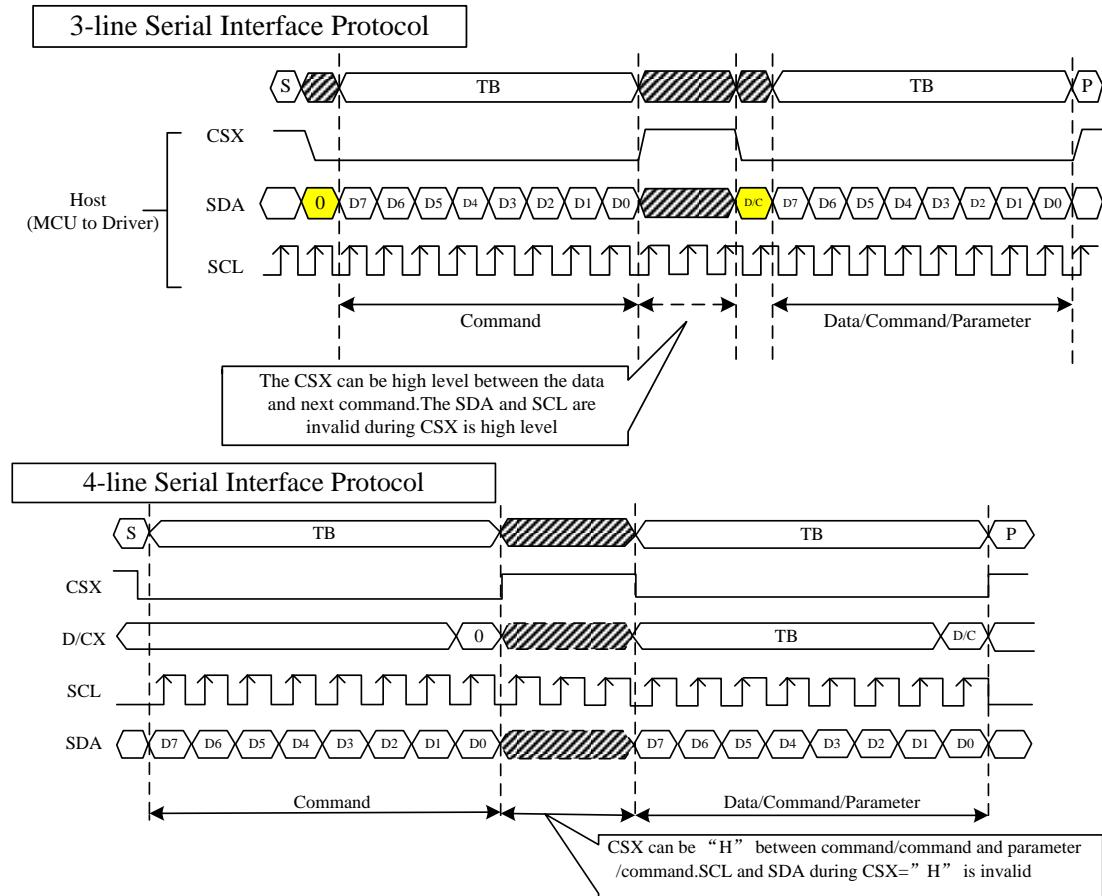

The write mode of the interface means that host writes commands or data to GC9107. The 3-lines serial data packet contains a data/command select bit (D/CX) and a transmission byte. If the D/CX bit is "low", the transmission byte is interpreted as a command byte. If the D/CX bit is "high", the transmission byte is stored as the display data RAM (Memory write command),or command register as parameter.

Any instruction can be sent in any order to GC9107 and the MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse and SDA data are no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission. See the detailed data format for 3-/4-line serial interface.

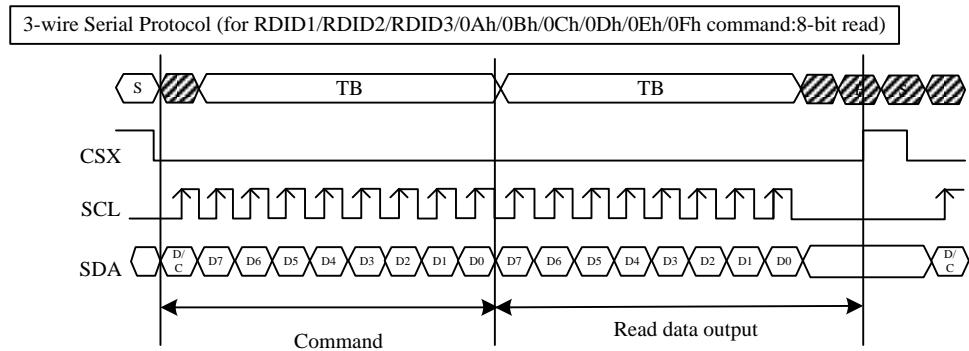

Host processor drives the CSX pin to low and starts by setting the D/CX bit on SDA. The bit is read by GC9107 on the first rising edge of SCL signal. On the next falling edge of SCL, the MSB data bit (D7) is set on SDA by the host. On the next falling edge of SCL, the next bit (D6) is set on SDA. If the optional D/CX signal is used, a byte is eight read cycle width. The 3/4-line serial interface writes sequence described in the figure as below.

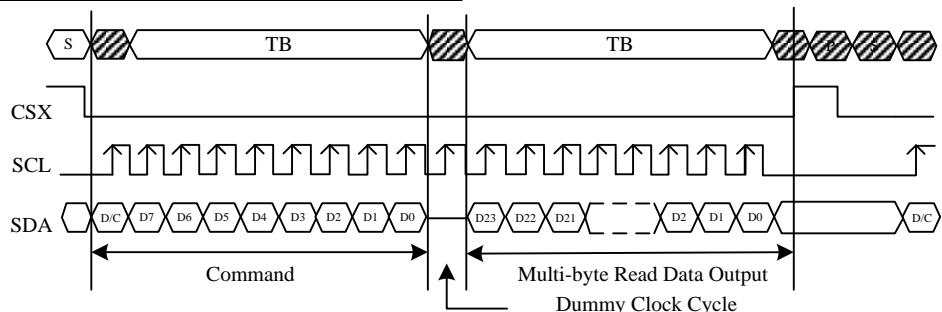

4.1.7. Read Cycle Sequence

The read mode of interface means that the host reads register's parameter from GC9107. The host has to send a command (Read ID or register command) and then the following byte is transmitted in the opposite direction. GC9107 latches the SDA (input data) at the rising edges of SCL (serial clock), and then shifts SDA (output data) at falling edges of SCL (serial clock). After the read status command has been sent, the SDA line must be set to tri-state and no later than at the falling edge of SCL of the last bit. The read mode has three types of transmitted command data (8-/24-/32-bit) according command code.

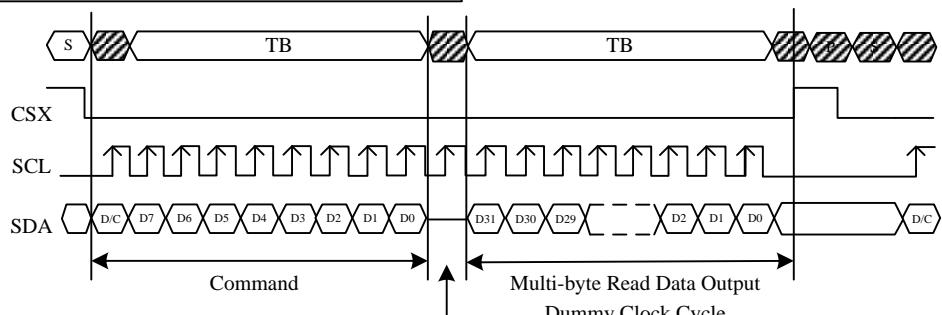

3-wire Serial Interface Protocol

3-wire Serial Protocol (for RDDID command:24-bit read)

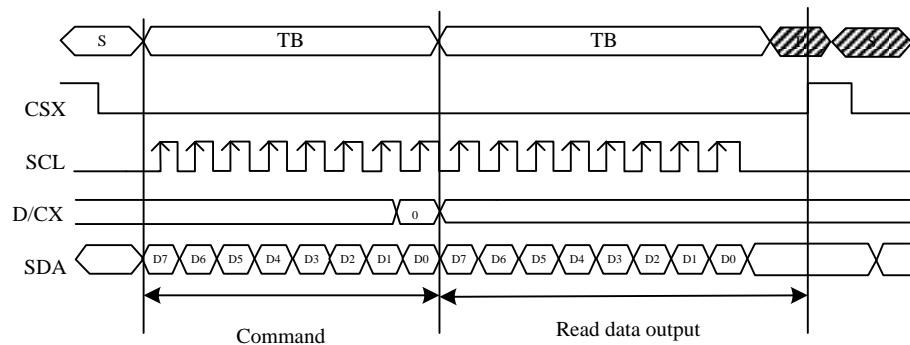

3-wire Serial Protocol (for RDDST command:32-bit read)

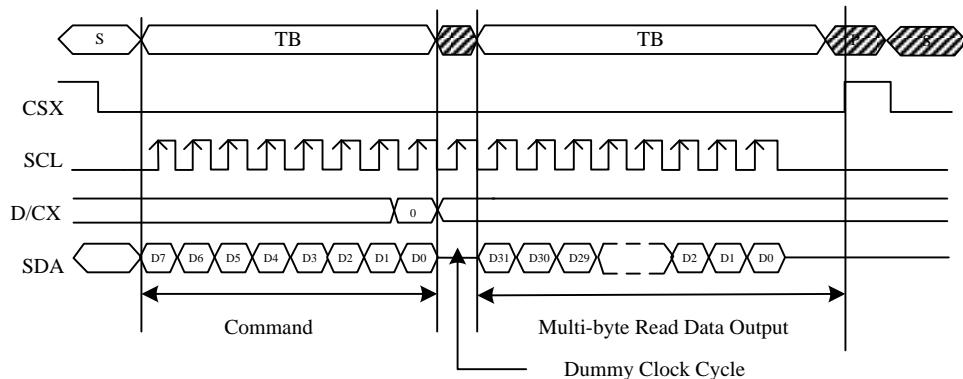

4-wire Serial Interface Protocol

4-wire Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command:8-bit read)

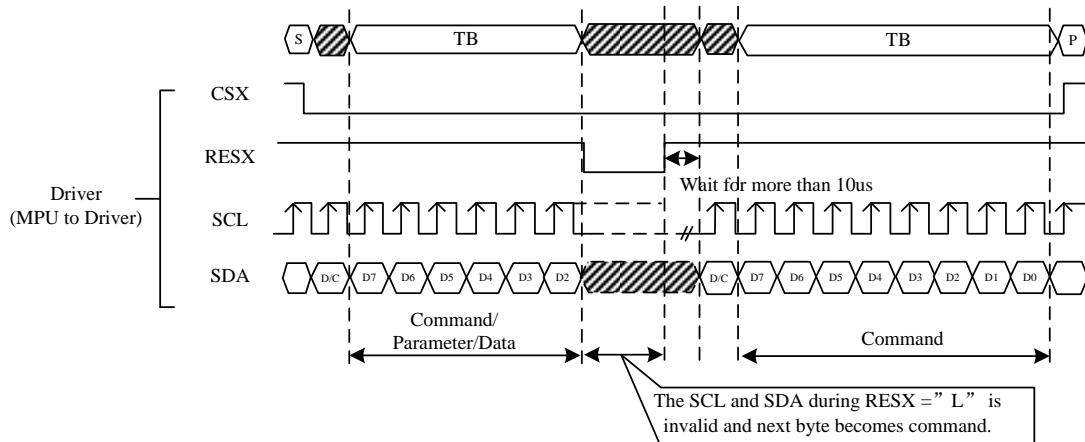

4-wire Serial Protocol (for RDDST command:32-bit read)

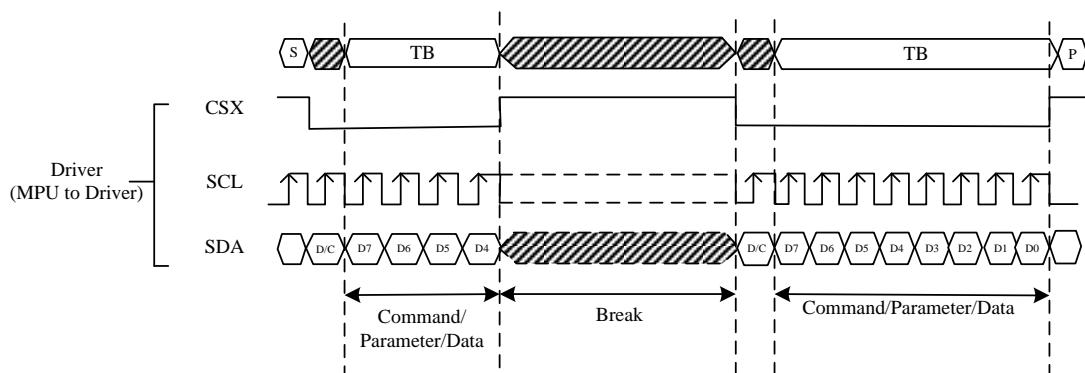

4.1.8. Data Transfer Break and Recovery

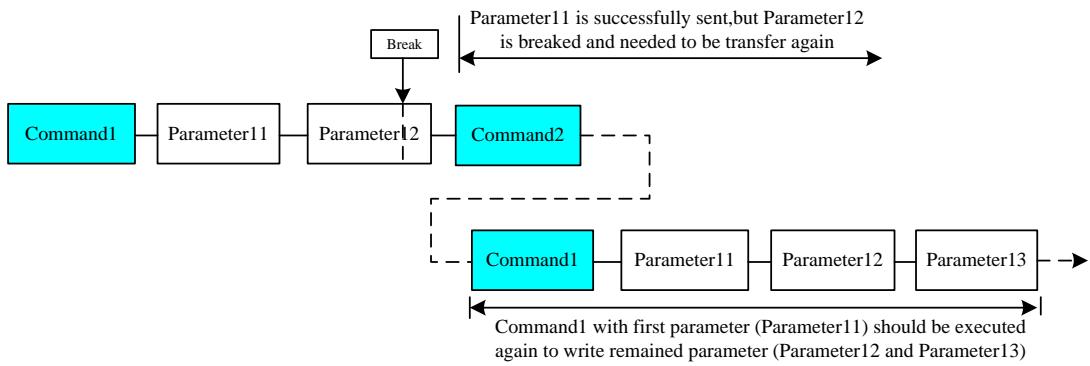

If there is a break in data transmission by RESX pulse, while transferring a command or multiple parameter command data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select pin (CSX) is activated after RESX have been high state.

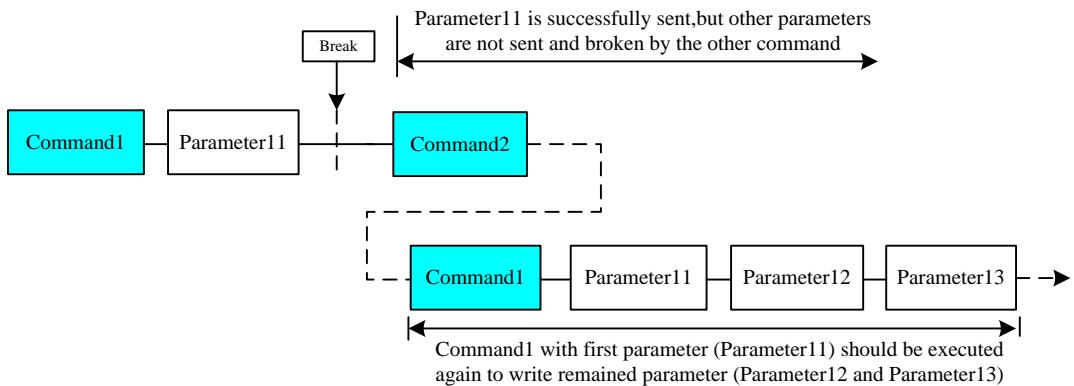

If there is a break in data transmission by CSX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select pin (CSX) is next activated.

If a two or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than continue to send the remained parameters that was interrupted, then the parameters which had been successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

If a two or more parameter command is being sent and a break occurs by the other command before the last one is sent, then the parameters which had been successfully sent are stored and the other parameter of that command remains previous value.

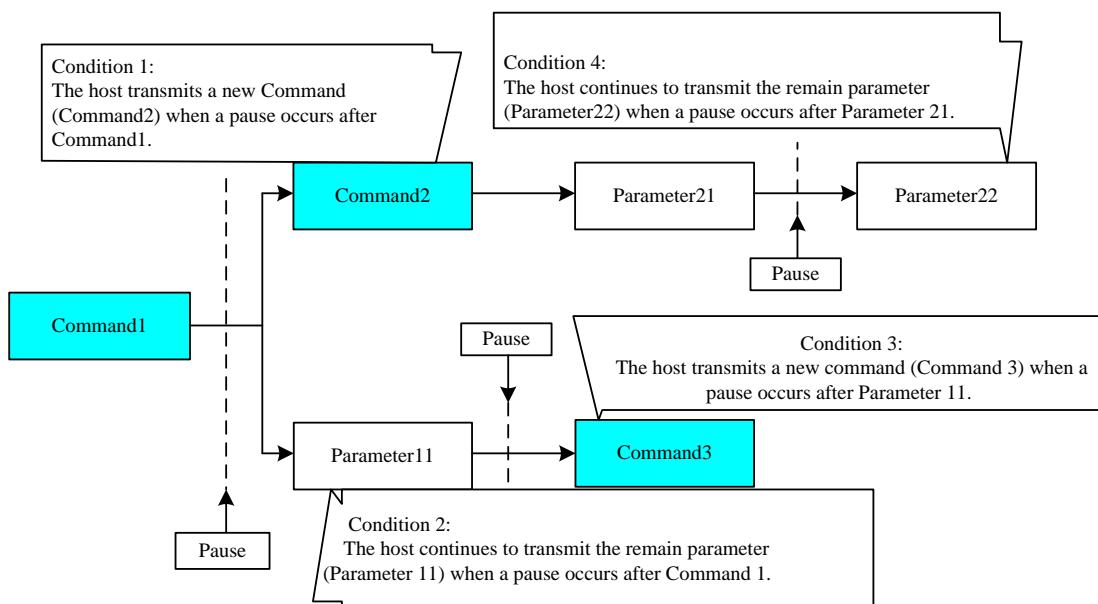

4.1.9. Data Transfer Pause

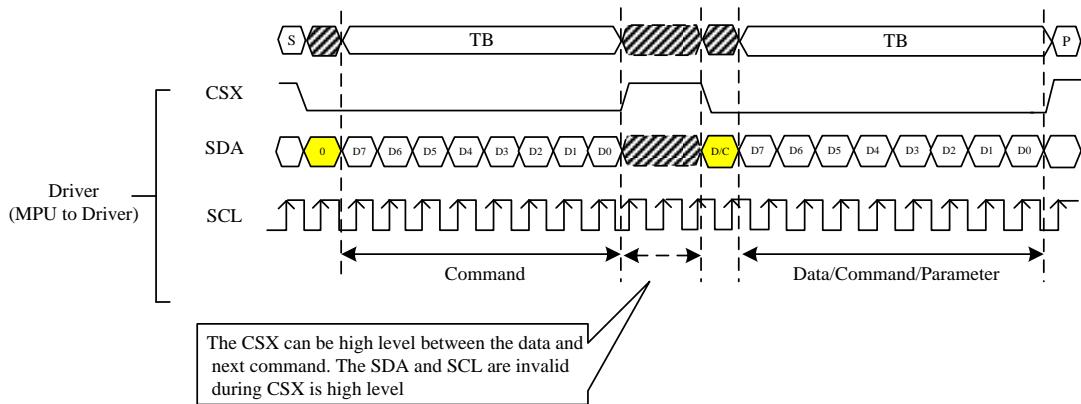

It will be possible when transferring a command, frame memory data or multiple parameter data to invoke a pause in the data transmission. If the chip select pin (CSX) is released to high state after a whole byte of a frame memory data or multiple parameter data has been completed, then GC9107 will wait and continue the frame memory data or parameter data transmission from the point where it was paused. If the chip select pin is released after a whole byte of a command has been completed, then the display module will receive either the command's parameters (if appropriate) or a new command when the chip select pin is next enabled as shown below.

This applies to the following 4 conditions:

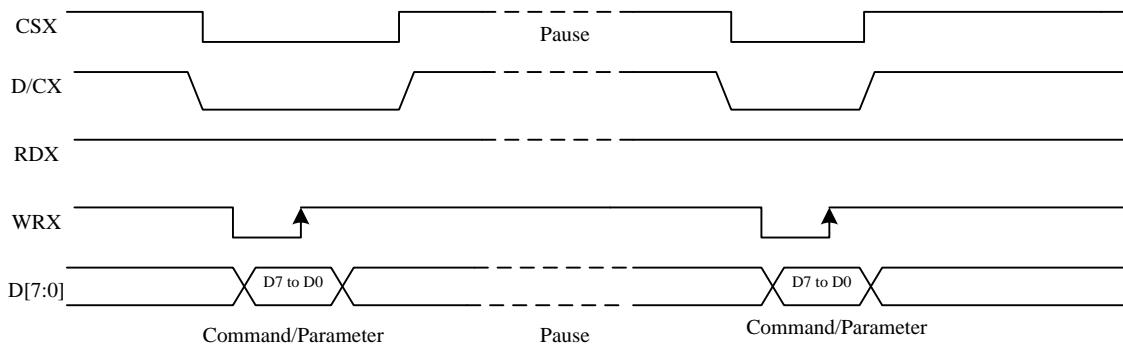

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

4.1.10. Serial Interface Pause

4.1.11. Parallel Interface Pause

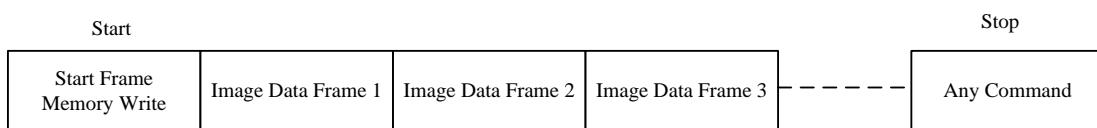

4.1.12. Data Transfer Mode

GC9107 can provide two different kinds of color depth (16-bit/pixel and 18-bit/pixel) display data to the graphic RAM. The data format is described for each interface. Data can be downloaded to the frame memory by 2 methods.

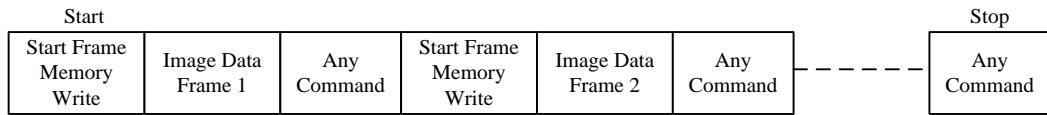

4.1.13. Data Transfer Method 1

The image data is sent to the frame memory in the successive frame writing, each time the frame memory is filled by image data, the frame memory pointer is reset to the start point and the next frame is written.

4.1.14. Data Transfer Method 2

Image data is sent and at the end of each frame memory download, a command is sent to stop frame memory writing. Then start memory write command is sent, and a new frame is downloaded.

Note 1: These methods are applied to all data transfer color modes on both serial and parallel interfaces.

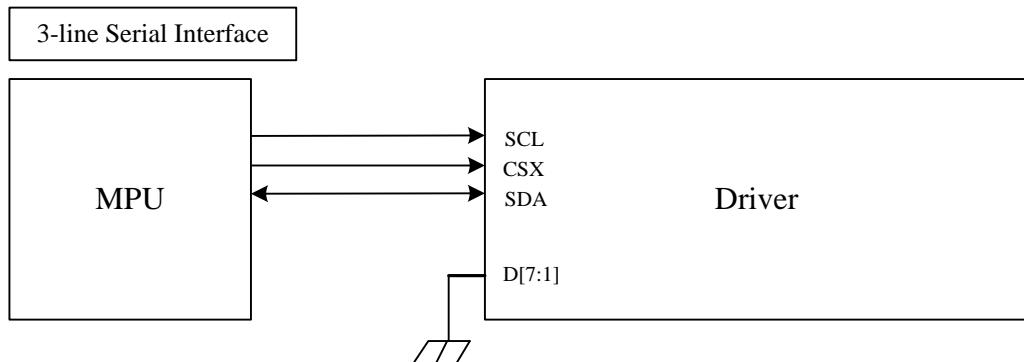

Note 2: The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

4.2. Display Data Format

GC9107 supplies 8-bit parallel MCU interface with 8080 series, 3-/4-line serial interface. The parallel MCU interface and serial interface mode can be selected by external pins IM and SPI4W.

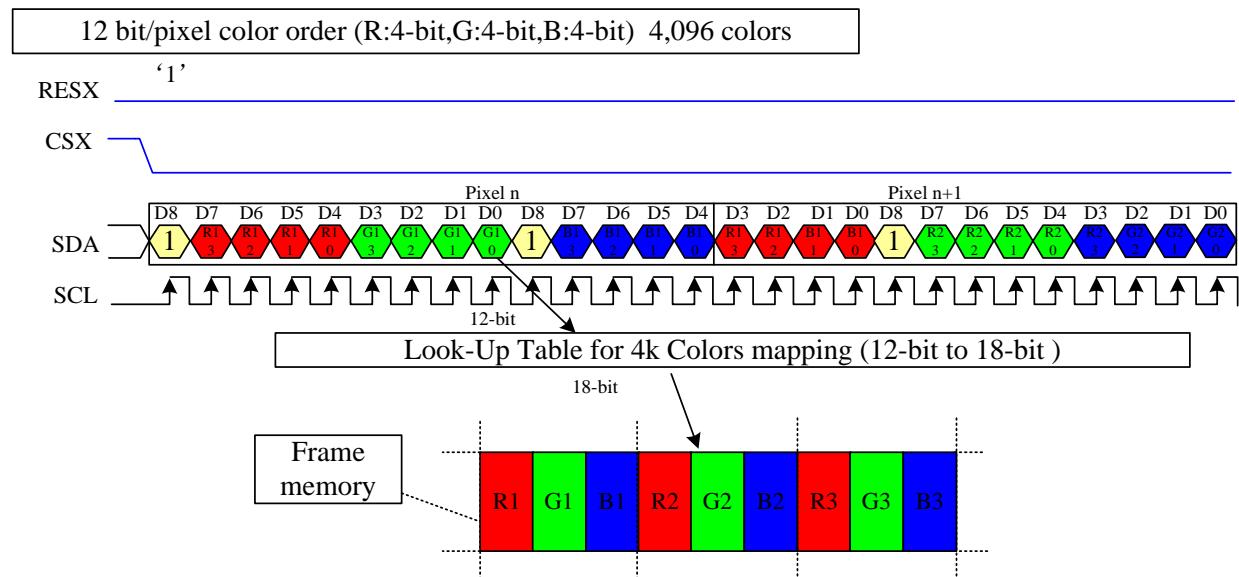

4.2.1. 3-line Serial Interface

The 3-line/9-bit serial bus interface of GC9107 can be used by setting external pin as IM to "0" and SPI4W to "0". The shown figure is the example of 3-line SPI interface.

In 3-line serial interface, different display data format is available for three color depths supported by the LCM listed below.

- 4k color, RGB 4, 4, 4 -bits input
- 65k colors, RGB 5, 6, 5 -bits input
- 262k colors, RGB 6, 6, 6 -bits input.

Two pixel (3 sub-pixels) display data is sent by 3 byte transfers when IFPF [2:0] bits of 3Ah register are set to "011".

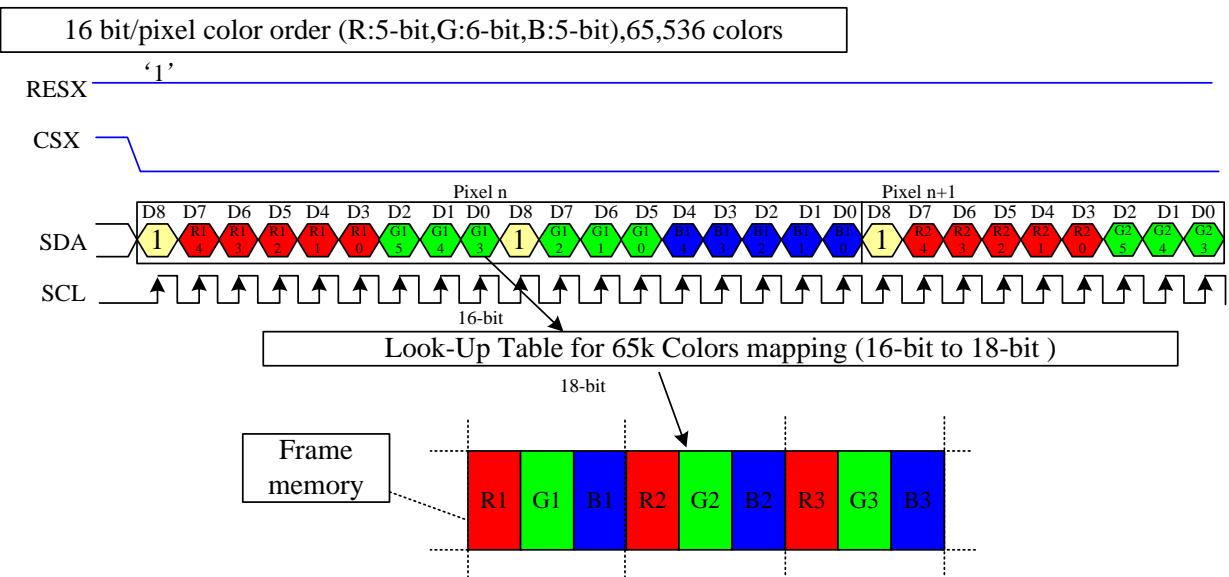

GC9107 Datasheet

Note 1: The pixel data with 12-bit color depth information.

Note 2: The most significant bits are: Rx3, Gx3 and Bx3.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-'= don't care –Can be set "0" or "1".

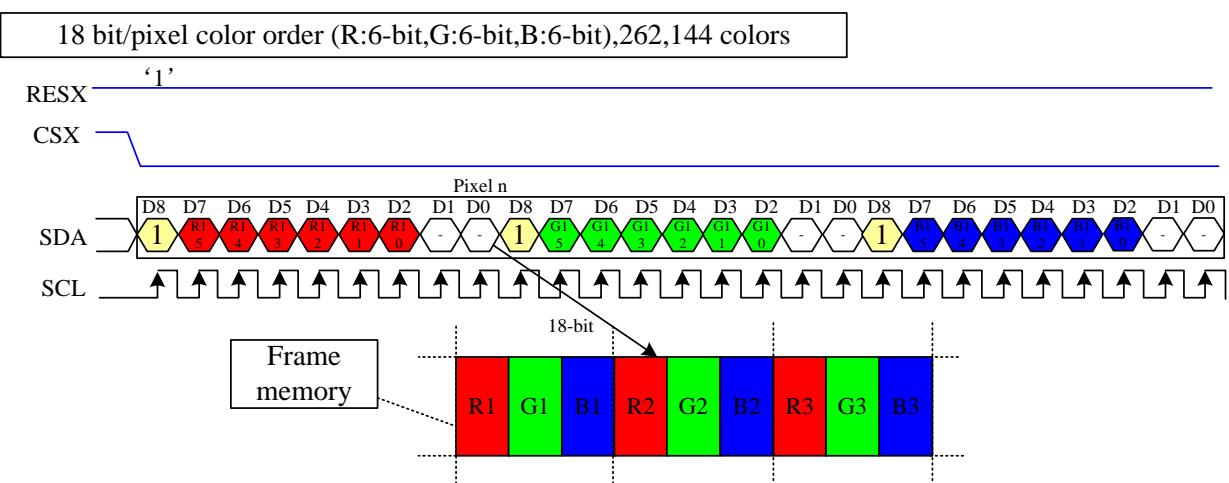

One pixel (3 sub-pixels) display data is sent by 2 byte transfers when IFPF [2:0] bits of 3Ah register are set to "101".

Note 1: The pixel data with 16-bit color depth information.

Note 2: The most significant bits are: Rx4, Gx5 and Bx4.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-'= don't care –Can be set "0" or "1".

One pixel (3 sub-pixels) display data is sent by 3 bytes transfer when IFPF [2:0] bits of 3Ah register are set to "110".

Note 1: The pixel data with 18-bit color depth information.

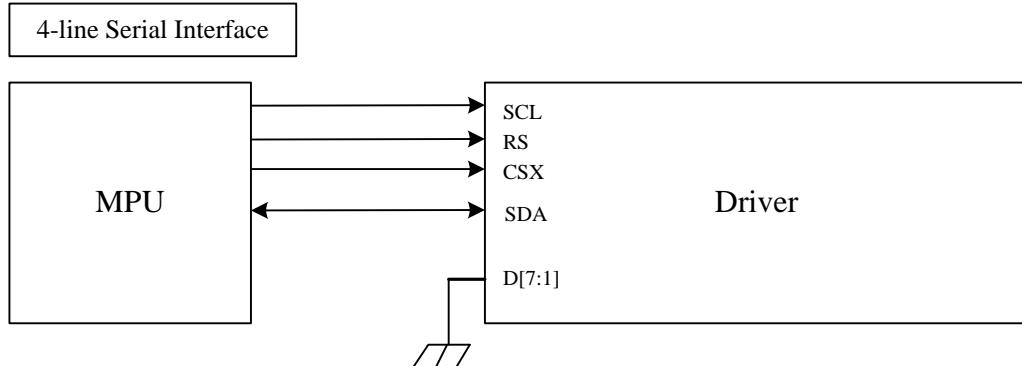

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are : Rx0, Gx0 and Bx0.

Note 4: '-'= don't care - Can be set "0" or "1".

4.2.2. 4-line Serial Interface

The 4-line/8-bit serial bus interface of GC9107 can be used by setting external pin as IM to “0” and SPI4W to “1”. The shown figure is the example of 4-line SPI interface.

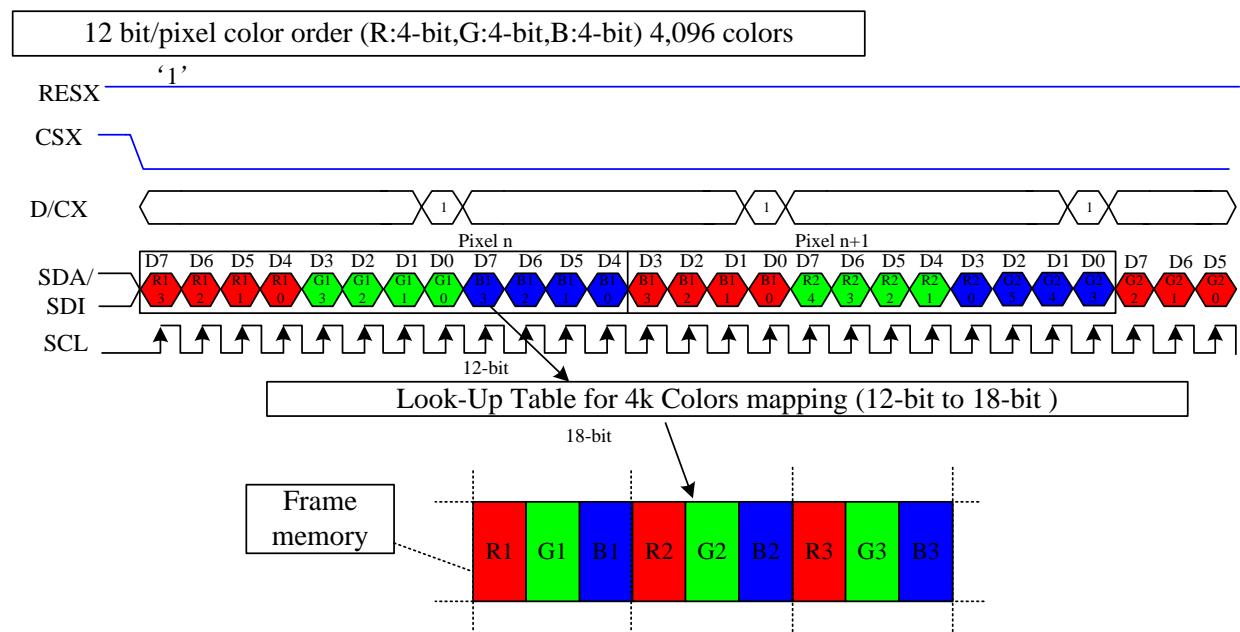

In 4-line serial interface, different display data format is available for two color depths supported by the LCM listed below.

-4Kk color, RGB 4, 4, 4 -bits input.

-65k colors, RGB 5, 6, 5 -bits input.

-262k colors, RGB 6, 6, 6 -bits input.

Two pixel (3 sub-pixels) display data is sent by 3 byte transfers when IFPF [2:0] bits of 3Ah register are set to “011”.

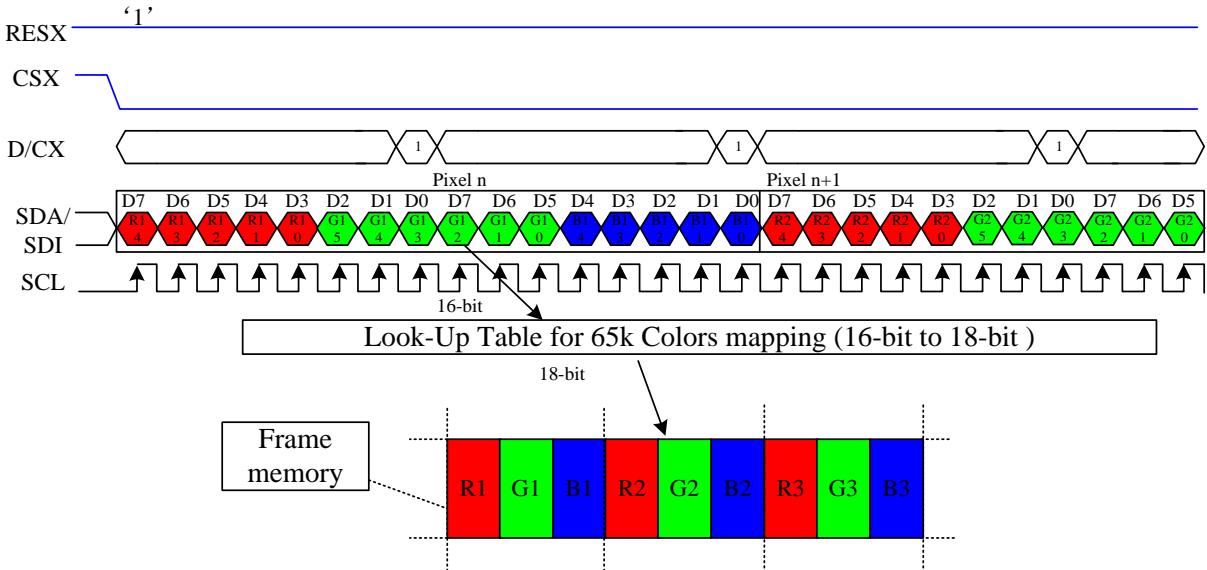

Note 1: The pixel data with 12-bit color depth information.

Note 2: The most significant bits are: Rx3, Gx3 and Bx3.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: ‘-= don't care –Can be set “0” or “1”.

16 bit/pixel color order (R:5-bit,G:6-bit,B:5-bit),65,536 colors

One pixel (3 sub-pixels) display data is sent by 2 byte transfers when IFPF [2:0] bits of 3Ah register are set to "101".

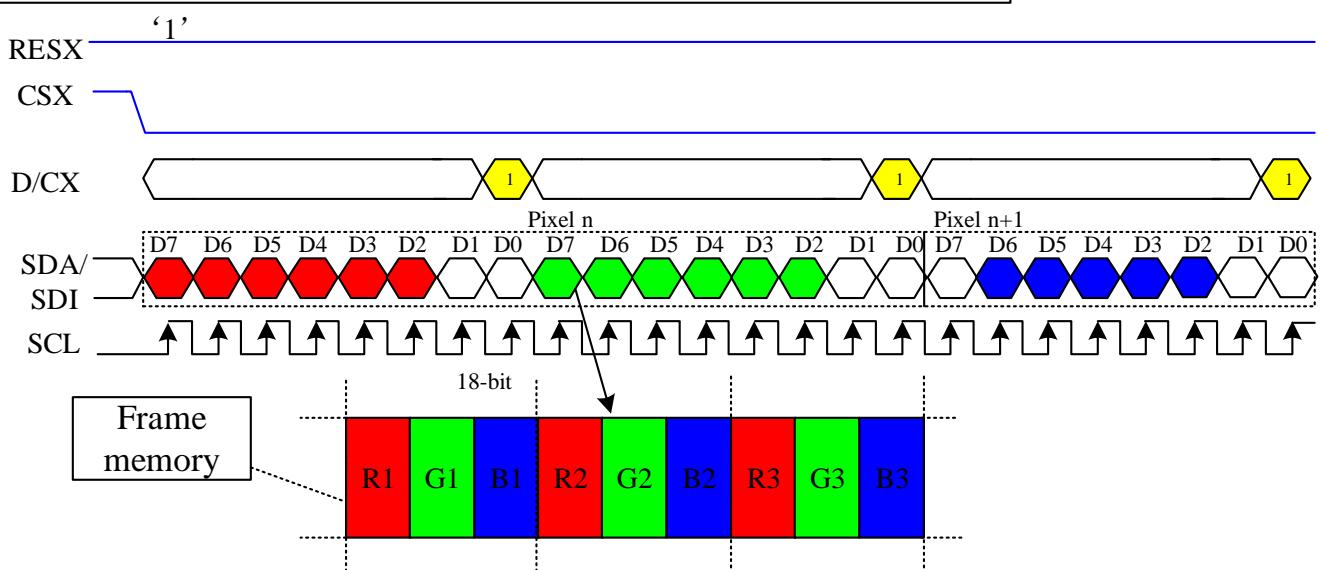

Note 1: The pixel data with 16-bit color depth information.

Note 2: The most significant bits are: Rx4, Gx5 and Bx4.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-'= don't care –Can be set "0" or "1".

18 bit/pixel color order (R:6-bit,G:6-bit,B:6-bit),262,144 colors

One pixel (3 sub-pixels) display data is sent by 3 bytes transfer when IFPF [2:0] bits of 3Ah register are set to "110".

Note 1: The pixel data with 18-bit color depth information.

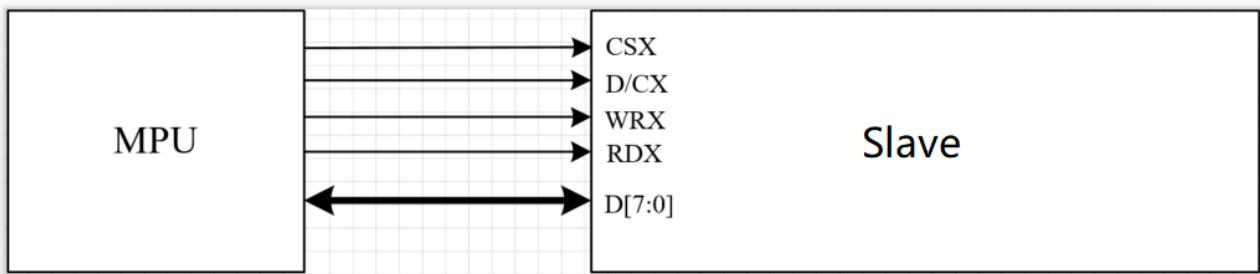

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-'= don't care –Can be set "0" or "1".

4.2.3. 8-bit Parallel MCU Interface

The 8-bit parallel bus interface of GC9107 can be used by setting external pin as IM [2:0] to "000". The following shown figure is the example of interface with 8-bits MCU system interface.

Different display data formats are available for three color depths supported by listed below.

- 4K-Color, RGB 4, 4, 4, -bits input data.
- 65K-Colors, RGB 5, 6, 5 -bits input data.
- 262K-Colors, RGB 6, 6, 6 -bits input data.

4K color: 12-bit/pixel (RGB 4-4-4 bits input)

Two pixel (3 sub-pixels) display data is sent by 3 byte transfers when IFPF [2:0] bits of 3Ah register are set to "011".

Count	0	1	2	3	4	5	6	...

154	152	7													152	7
155	153	6													153	6
156	154	5													154	5
157	155	4													155	4
158	156	3													156	3
159	157	2													157	2
160	158	1													158	1
161	159	0													159	0
CA	MX= ‘0’	0			1					126			127			
	MX= ‘1’	127			126					1			0			

Note

RA = Row Address

CA = Col Address

SA = Scan Address

MX = Mirror X-axis (Column address direction parameter), D6 parameter of MADCTL command

MY = Mirror Y-axis (Row address direction parameter), D7 parameter of MADCTL command

ML = Scan direction parameter, D4 parameter of MADCTL command

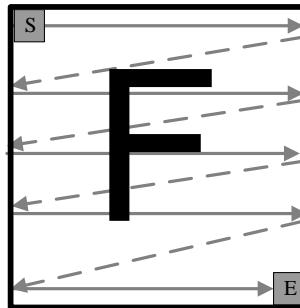

RGB = Red, Green and Blue pixel position change, D3 parameter of MADCTL command

5.2. Address Counter (AC) of GRAM

The GC9107 contains an address counter (AC) which assigns address for writing/reading pixel data to/from GRAM. The address pointers set the position of GRAM. Every time when a pixel data is written into the GRAM, the X address or Y address of AC will be automatically increased by 1 (or decreased by 1), which is decided by the register (**MV**, **MX** and **MY** bits) setting.

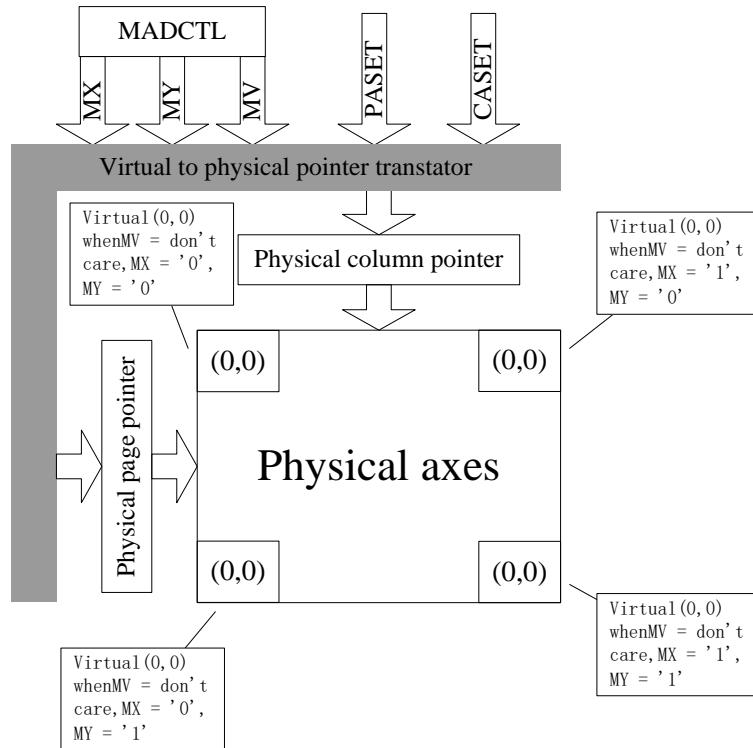

To simplify the address control of GRAM access, the window address function allows for writing data only to a window area of GRAM specified by registers. After data being written to the GRAM, the AC will be increased or decreased within setting window address-range which is specified by the (start: **SC**, end: **EC**) and the (start: **SP**, end: **EP**). Therefore, the data can be written consecutively without thinking a data wrap by those bit function.

Image data sending order from host and data stream update as shown in the following figure

The data is written in the order illustrated above. The counter which dictates where in the physical memory the data is to be written is controlled by **MV**, **MX** and **MY** bits setting

Image data writing control:

For each image orientation, the controls for the column and page counters apply as below:

condition	Column Counter	Page Counter
When RAMWR/RAMRD command is accepted	Return to "Start Column"	Return to "Start Page"
Complete Pixel Pair Write/Read action	Increment by 1	No change
The Column counter value is larger than "End column."	Return to "Start Column"	Increment by 1
The Page counter value is larger than "End page".	Return to "Start column"	Return to "Start Page"

5.2.1. 128RGBx160 (GM == '11')

CASET and PASET control for physical column/page pointers:

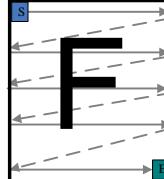

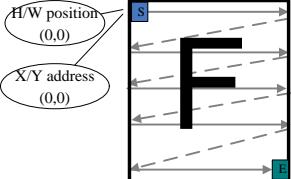

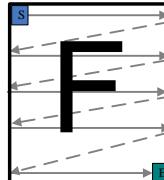

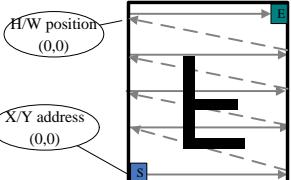

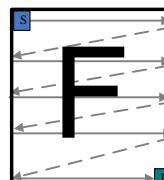

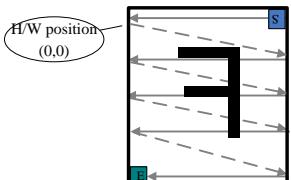

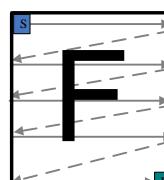

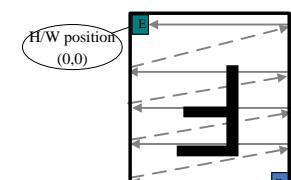

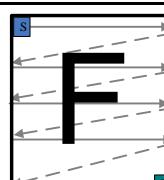

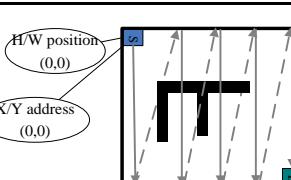

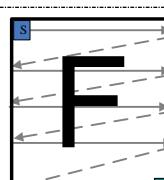

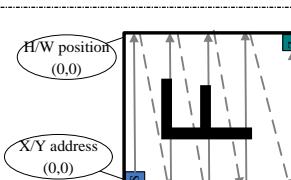

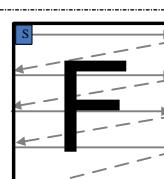

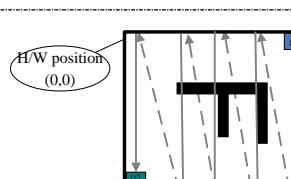

MV	MX	MY	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Page Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (161 - Physical Page Pointer)
0	1	0	Direct to (127 - Physical Column Pointer)	Direct to Physical Page Pointer
0	1	1	Direct to (127 - Physical Column Pointer)	Direct to (161 - Physical Page Pointer)
1	0	0	Direct to Physical Page Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (161 - Physical Page Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Page Pointer	Direct to (127 - Physical Column Pointer)
1	1	1	Direct to (161 - Physical Page Pointer)	Direct to (127 - Physical Column Pointer)

5.2.2. 128RGBx128 (GM == '01')

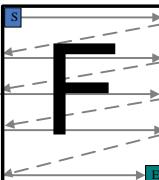

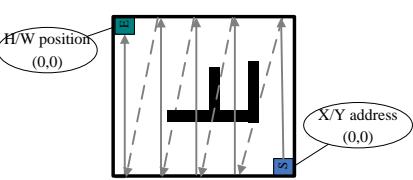

MV	MX	MY	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Page Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (127 - Physical Page Pointer)
0	1	0	Direct to (127 - Physical Column Pointer)	Direct to Physical Page Pointer
0	1	1	Direct to (127 - Physical Column Pointer)	Direct to (127 - Physical Page Pointer)
1	0	0	Direct to Physical Page Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (127 - Physical Page Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Page Pointer	Direct to (127 - Physical Column Pointer)
1	1	1	Direct to (127 - Physical Page Pointer)	Direct to (127 - Physical Column Pointer)

5.2.3. Frame Data Write Direction

The following figure depicts the GRAM address update method with MV, MX and MY bit setting.

Display data direction	MV	MX	MY	Image in the Host	Image in the Driver (GRAM)
normal	0	0	0		
Y-invert	0	0	1		
X-invert	0	1	0		
Y-invert X-invert	0	1	1		
X-Y exchange	1	0	0		
X-Y exchange Y-invert	1	0	1		
X-Y exchange X-invert	1	1	0		

GC9107 Datasheet

X-Y exchange Y-invert X-invert	1	1	1		
---	---	---	---	---	--

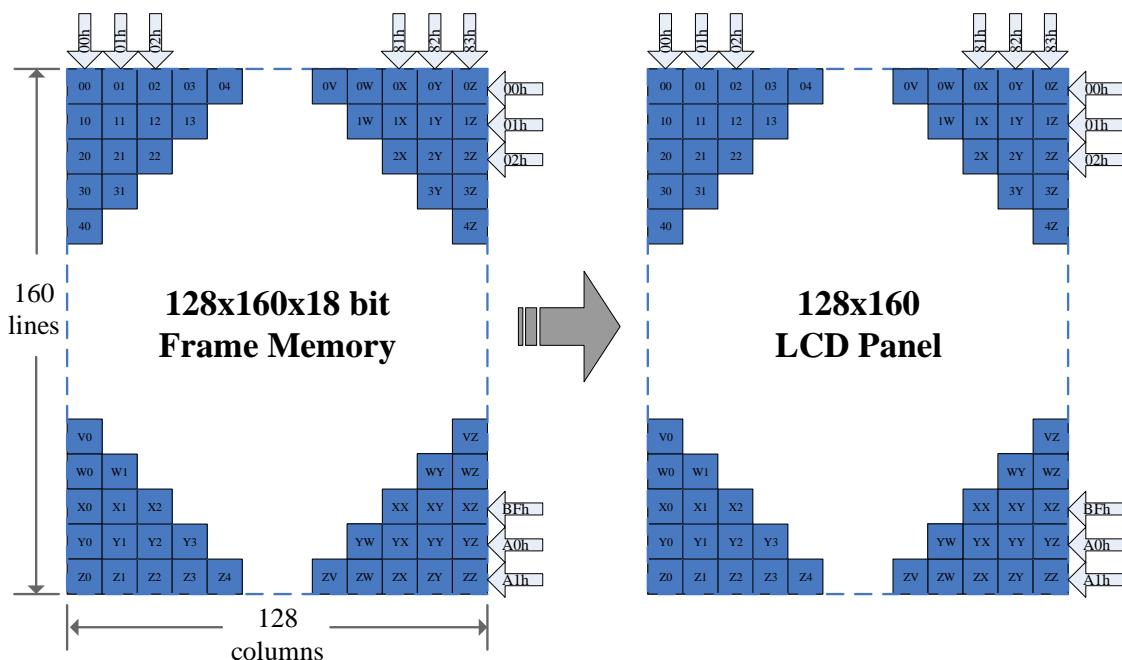

5.3. GRAM to display address mapping

GC9107 supports three kinds of display mode: one is Normal Display Mode, one is the other is Partial Display Mode, and Scrolling Display Mode.

5.3.1. Normal display on or partial mode on, vertical scroll off

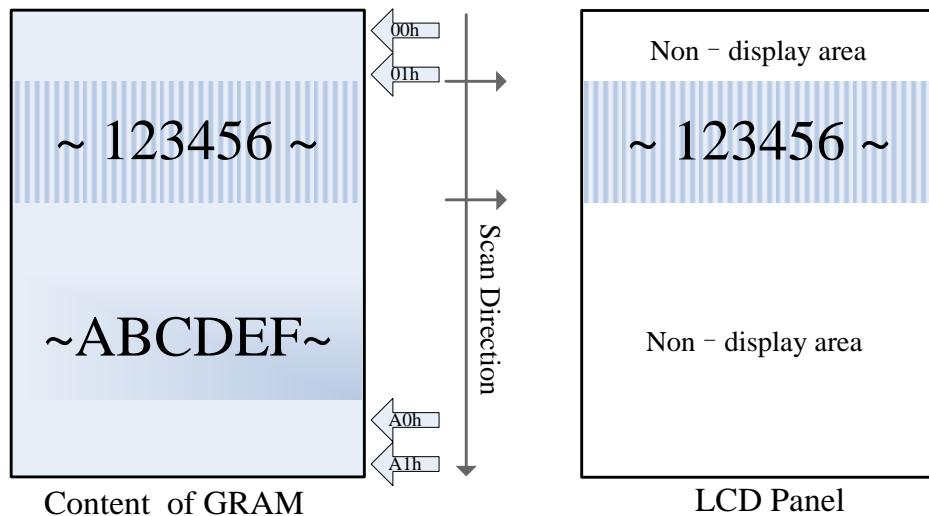

In this mode, content of the frame memory within an area where column pointer is 0000h to 007fh and page pointer is 0000h to 009fh is displayed.

To display a dot on leftmost top corner, store the dot data at (column pointer, page pointer) = (0,0)

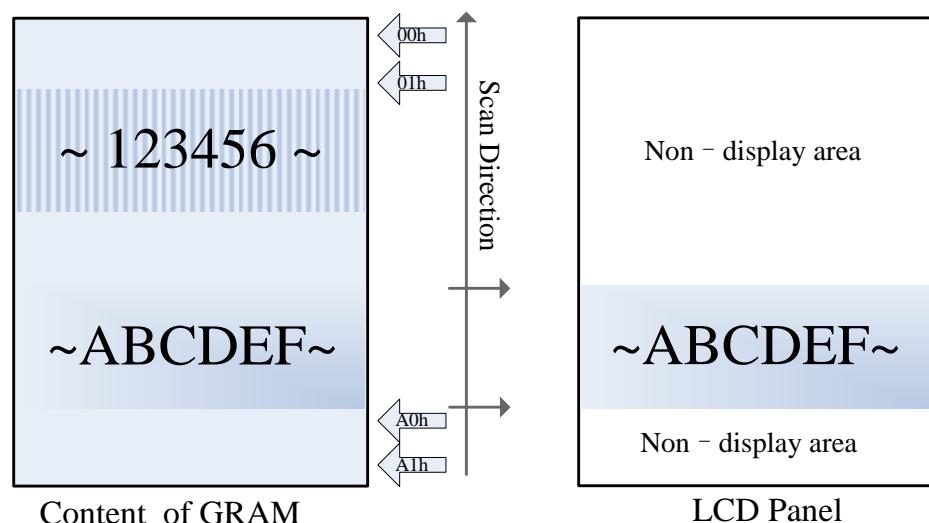

Example1:

- (1) Partial mode on (setting 12h)
- (2) SR [15:0] ='20d', ER [15:0] ='50d', MADCTL's B4(ML)= '0'.

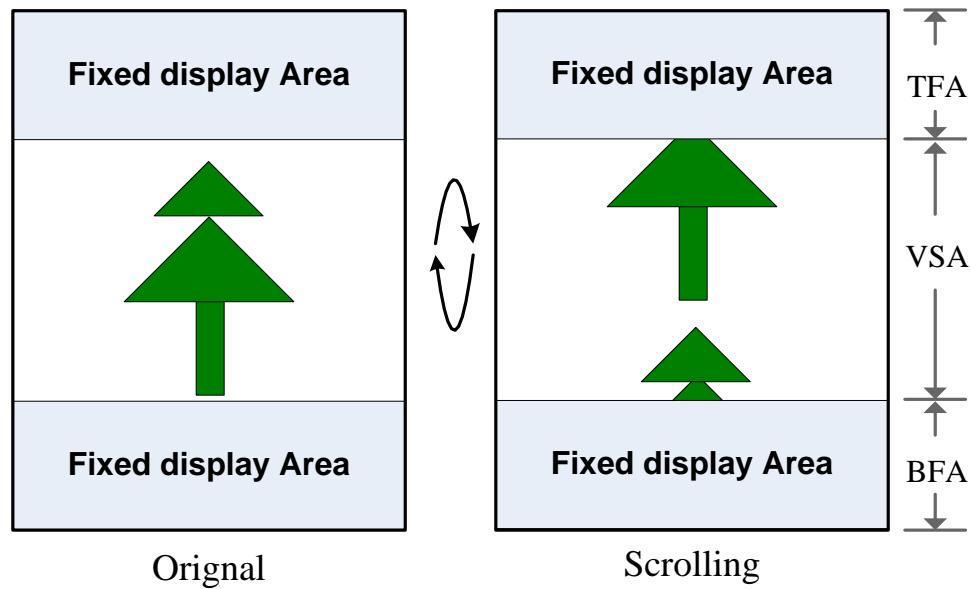

Example2:

- (1) Partial mode on (setting 12h)
- (2) SR [15:0] ='20d', ER [15:0] ='50d', MADCTL's **B4(ML)= '1'**.

5.3.2. Vertical scroll display mode

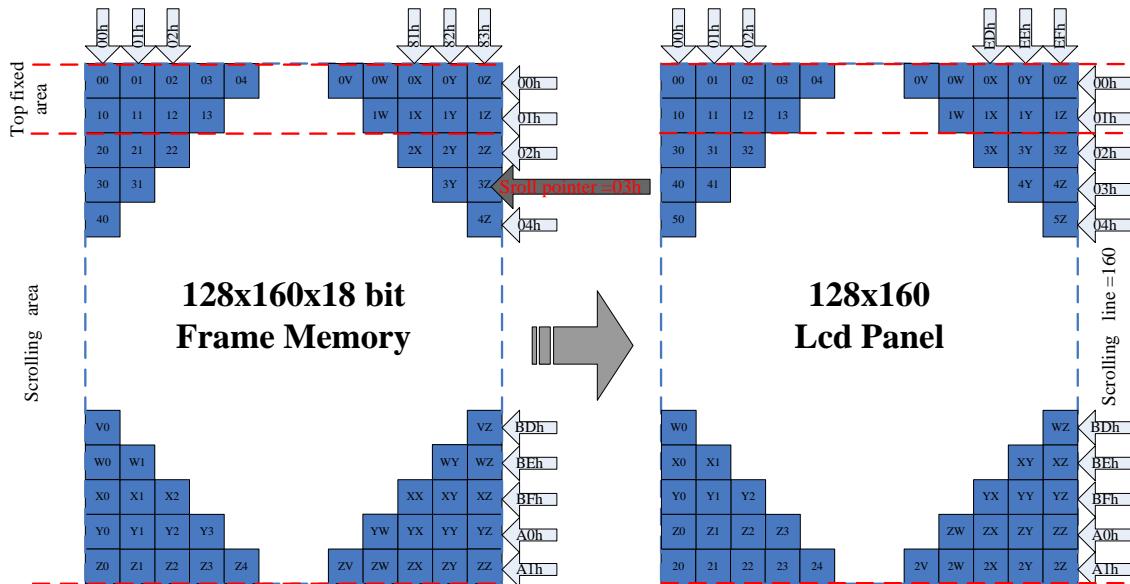

When setting R37h, the scrolling display mode is active, and the vertical scrolling display is specified by **TFA**, **VSA**, **BFA** bits (R33h) and **SSA** bits (R37h).

When Vertical Scrolling Definition Parameters ($TFA+VSA+BFA=160$). In this case, scrolling is applied as shown below.

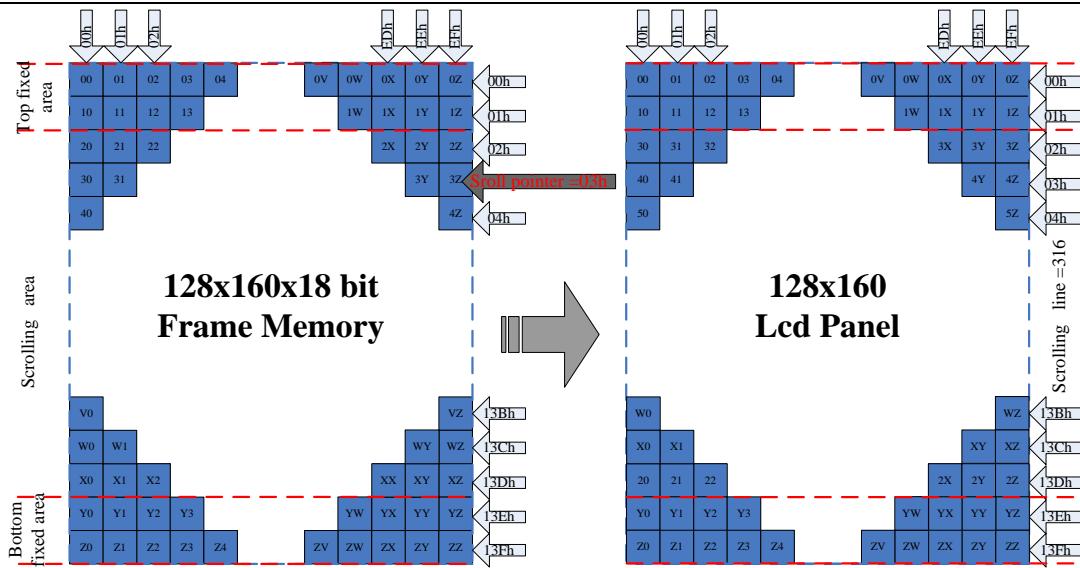

Example 1 . $TFA='2d'$, $VSA='160d'$, $BFA='0d'$, $SSA='3d'$ (SS='0', GS='0')

Memory map of vertical scrolling 1:

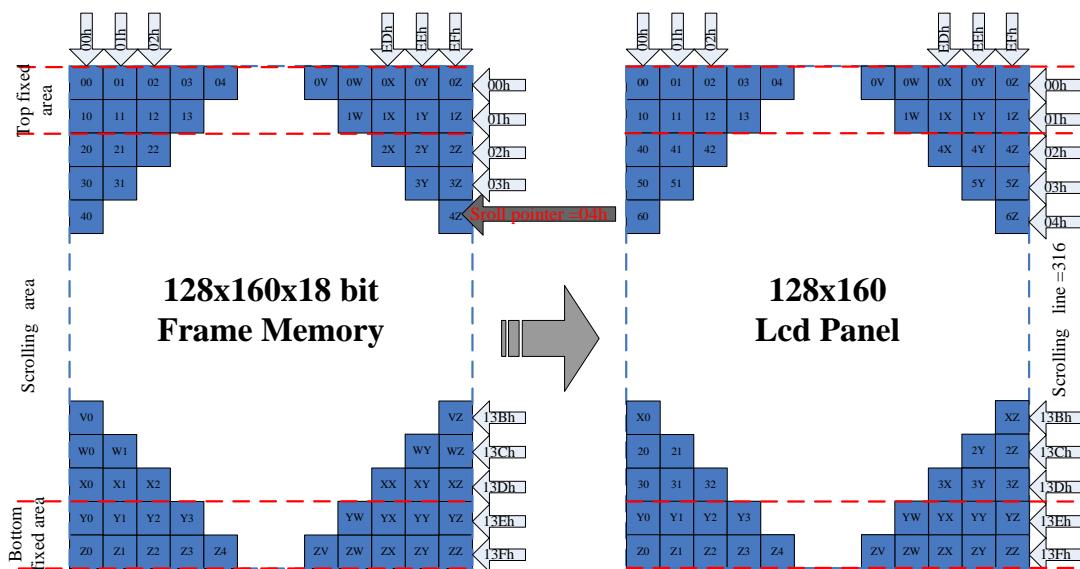

Example 2 . $TFA='2d'$, $VSA='158d'$, $BFA='2d'$, $SSA='3d'$ (SS='0', GS='0')

Memory map of vertical scrolling 2:

Example 3 .TFA='2d', VSA='158d', BFA='2d', SSA='4d' (SS='0', GS='0')

Memory map of vertical scrolling 3:

Vertical scroll example

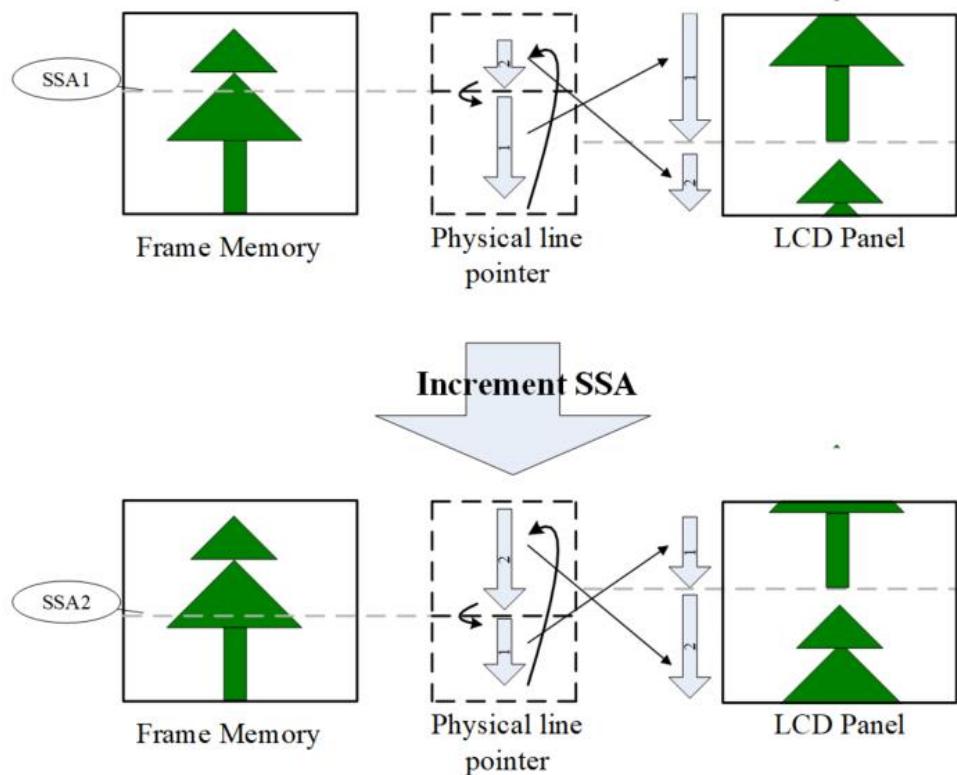

There are 2 types of vertical scrolling, which are determined by the **TFA**, **VSA**, **BFA** bits and **SSA** bits

Case 1: TFA + VSA + BFA ≠ '160d'

N/A: Do not set TFA + VSA + BFA ≠ '160d'. In that case, unexpected picture will be shown.

Case 2: TFA + VSA + BFA = '160d' (Scrolling)

Example (1) When TFA='0d', VSA='160d', BFA='0d' and SSA1='40d' & SSA2='100d' (SS ='0', GS='0')

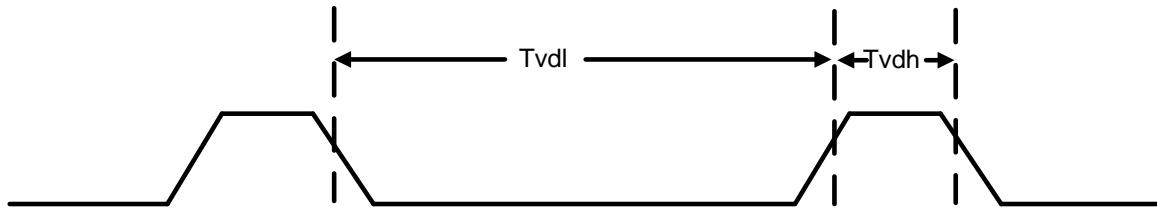

5.4. Tearing effect output line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory writing when displaying video images.

5.4.1. Tearing effect line modes

Mode 1, The Tearing Effect Output signal consists of V-Blinking Information only:

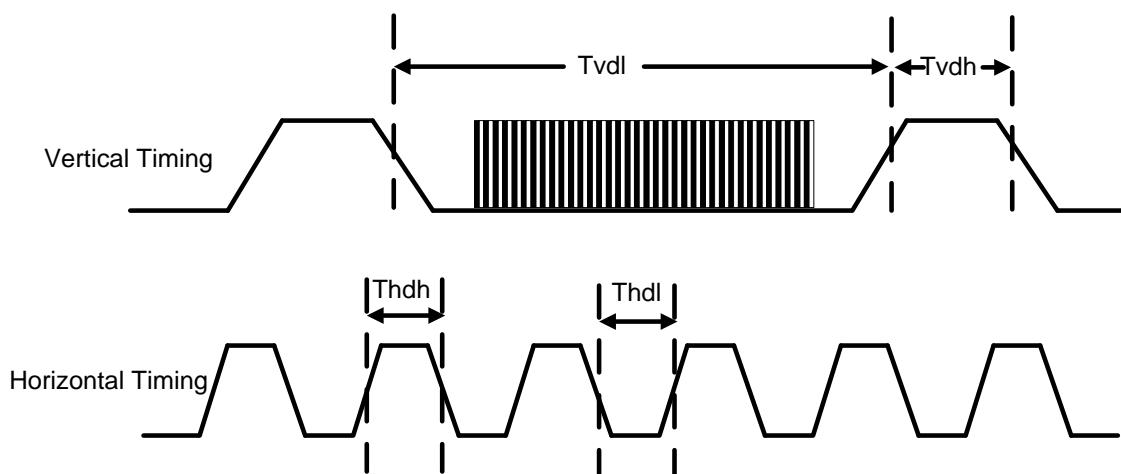

T_{line} is the display time of every line

$TVdh=(181-128)*T_{line}$ when GM[1:0]=01 , $TVdh=(181-160)*T_{line}$ when GM[1:0]=11.

$TVdI=128*T_{line}$ when GM[1:0]=01 , $TVdI=160*T_{line}$ when GM[1:0]=11.

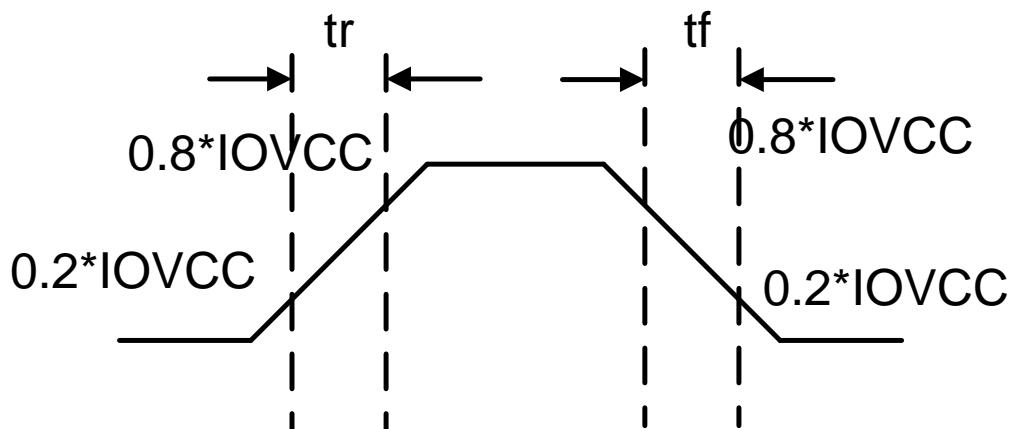

5.4.2. Tearing effect line timing

The Tearing Effect signal is described below.

Symbol	Parameter	Spec.			Description
		Min.	Max.	Unit	
tvdl	Vertical Timing Low Duration	TBD	-	ms	-
tvdh	Vertical Timing High Duration	1000	-	us	-
thdl	Horizontal Timing Low Duration	TBD	-	us	-
thdh	Horizontal Timing High Duration	TBD	500	us	-

Note: Idle Mode Off (Frame Rate = 60 Hz) ,The signal's rise and fall times (tf, tr) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the MCU and should be used to avoid Tearing Effect.

5.5. Source driver

The GC9107 contains a 384 channels of source driver (S1~S384) which is used for driving the source line of TFT LCD panel. The source driver converts the digital data from GRAM into the analog voltage for 384 channels and generates corresponding gray scale voltage output, which can realize a 262K colors display simultaneously.

Since the output circuit of this source driver incorporates an operational amplifier, a positive and a negative voltage can be alternately outputted from each channel.

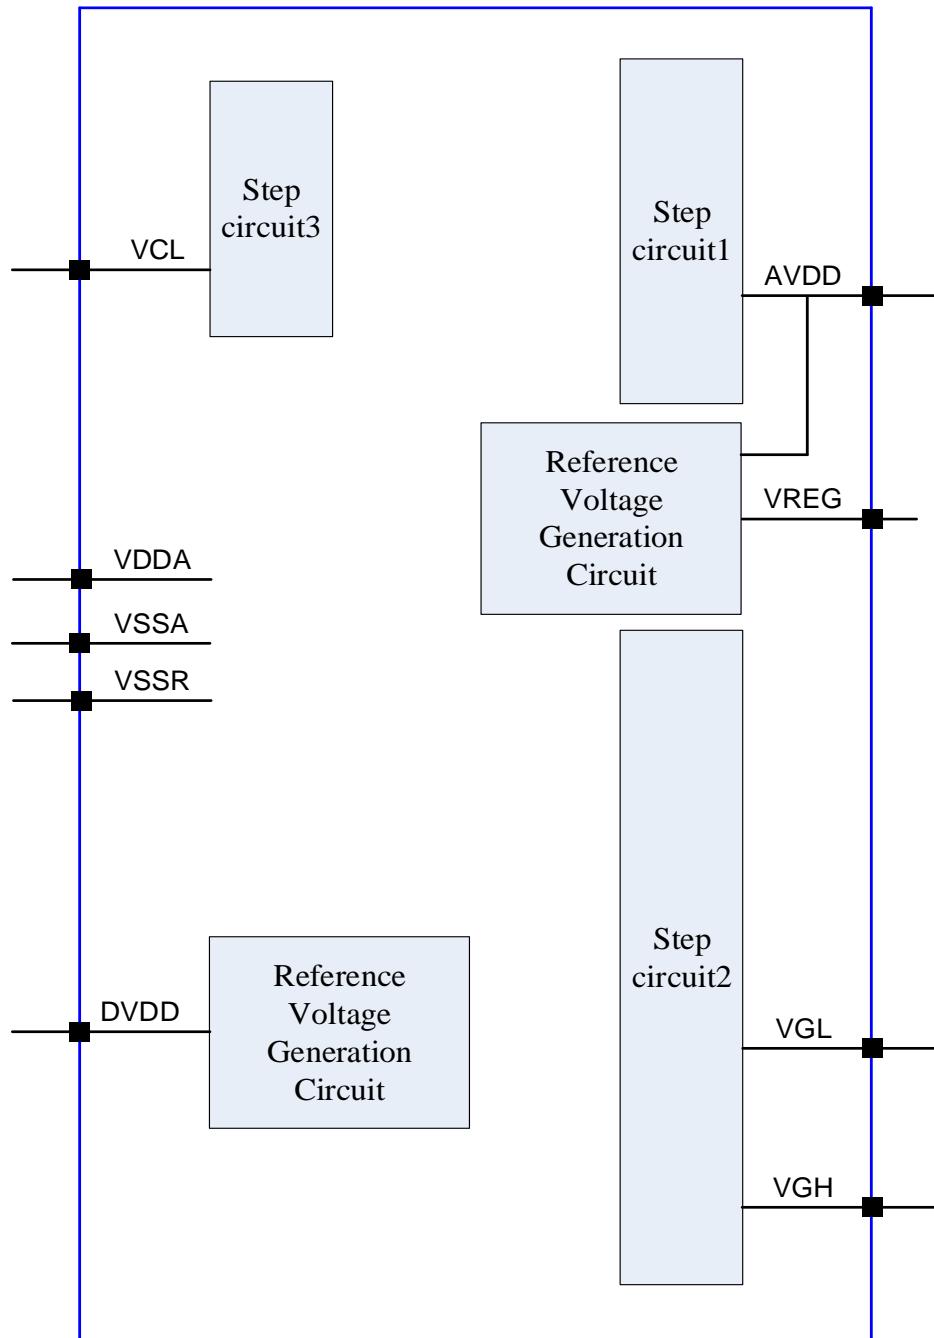

5.6. Gate driver

The GC9107 contains a 160 gate channels of gate driver (G2~G161) which is used for driving the gate. The gate driver level is VGH when scan some line, VGL the other lines.

5.7. LCD power generation circuit

5.7.1. Power supply circuit

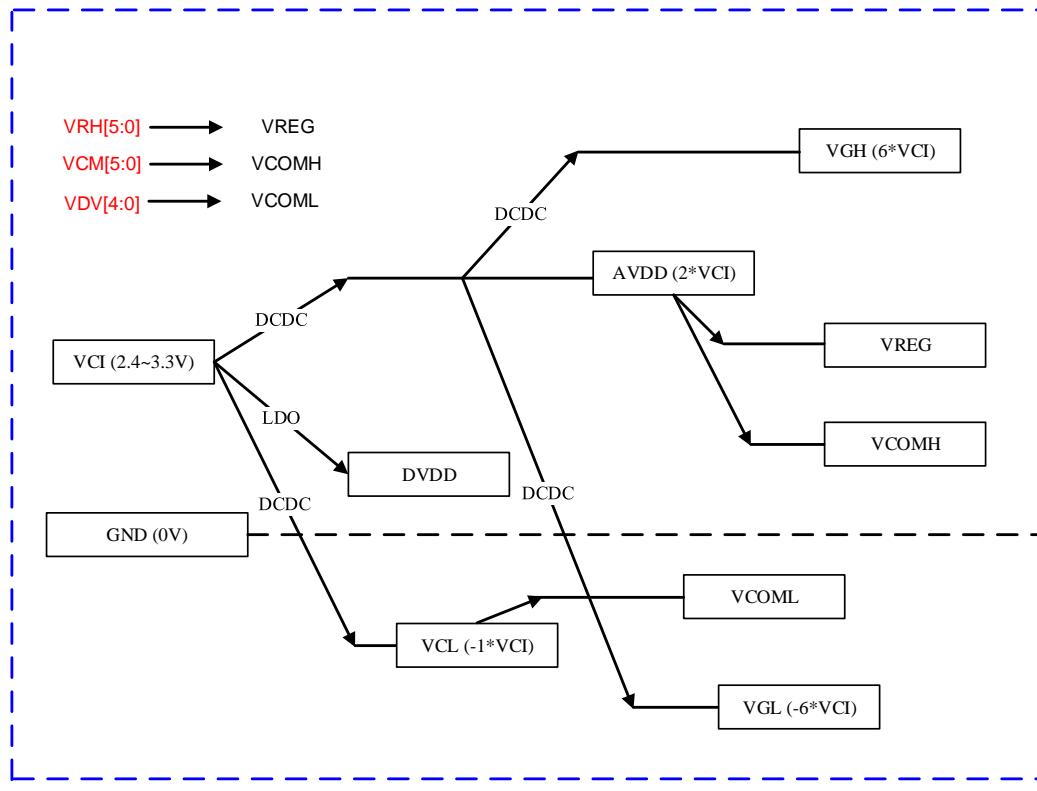

The power circuit of GC9107 is used to generate supply voltages for LCD panel driving.

Block diagram of GC9107 power circuit

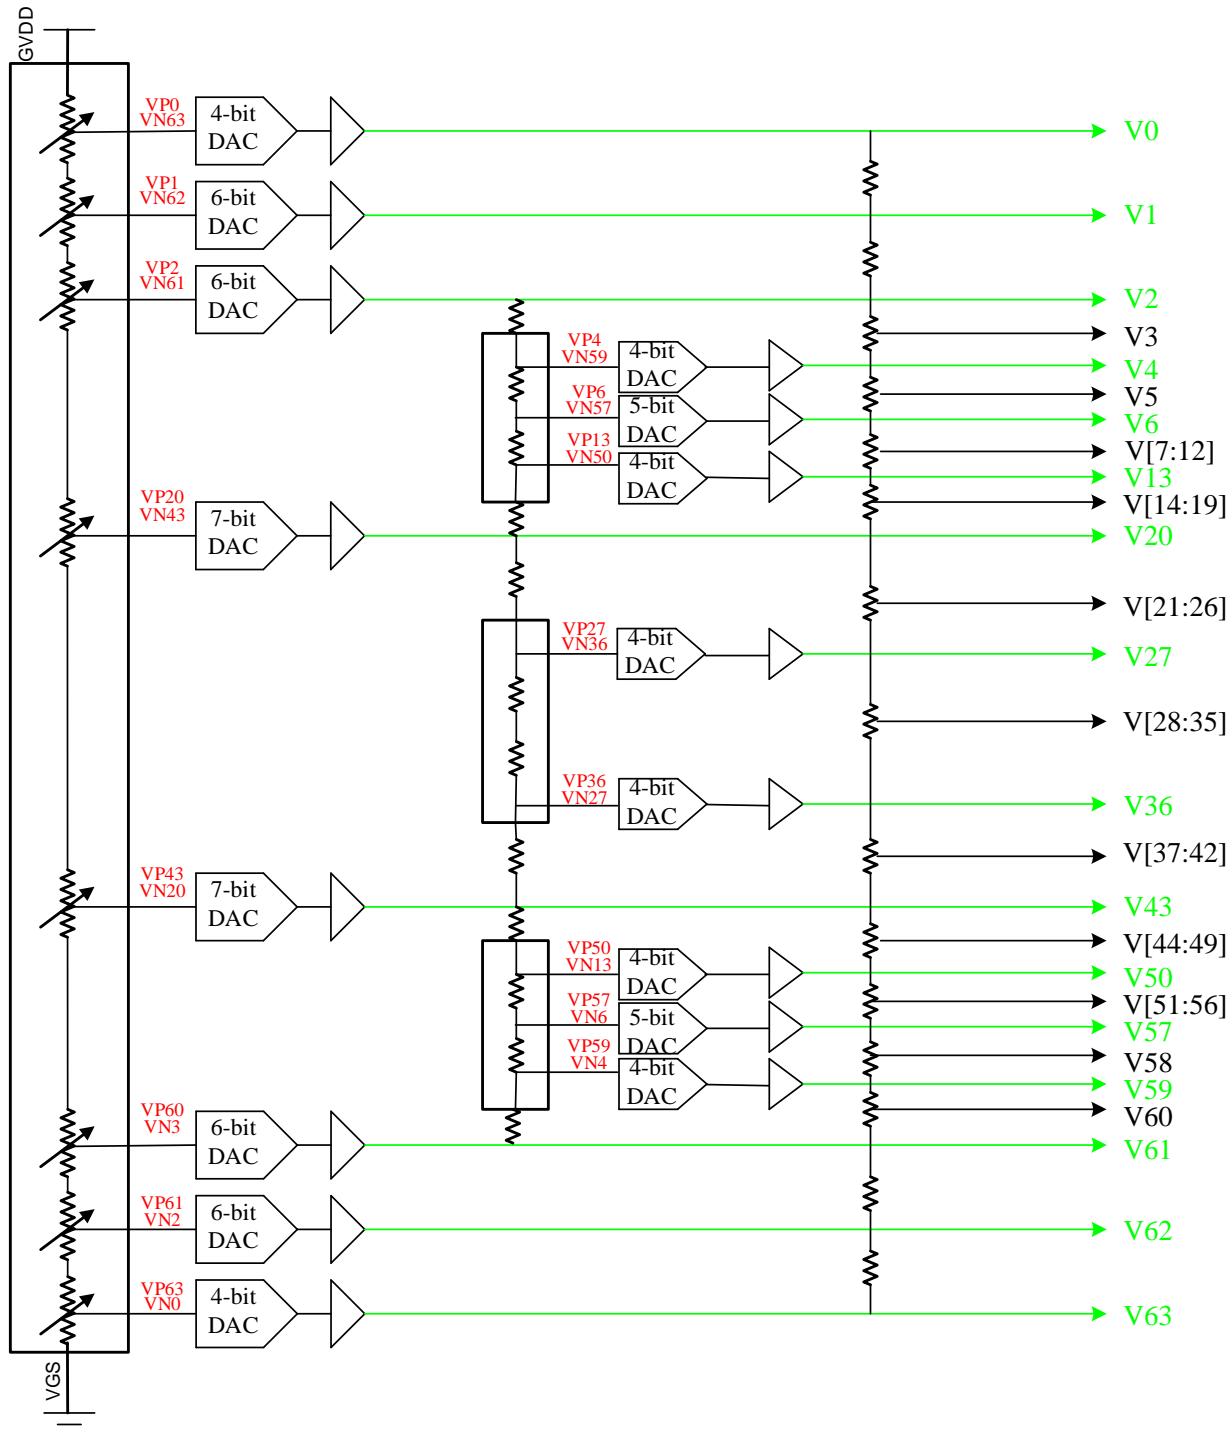

5.7.2. LCD power generation scheme

The boost voltage generated is shown as below.

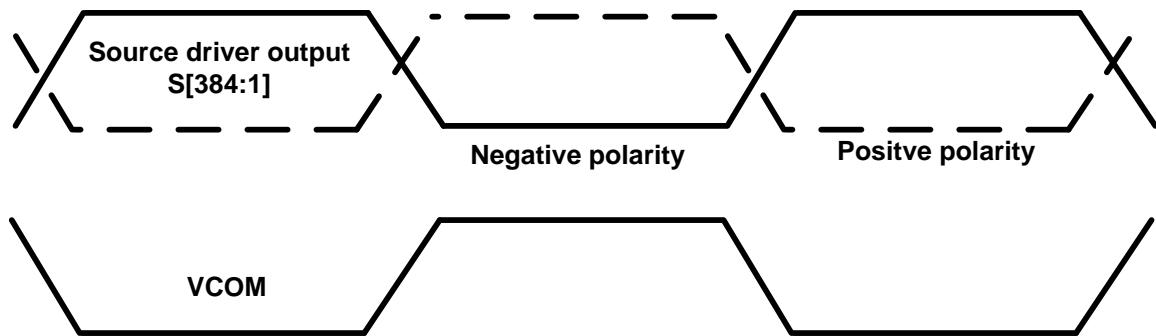

5.8. Gamma Correction

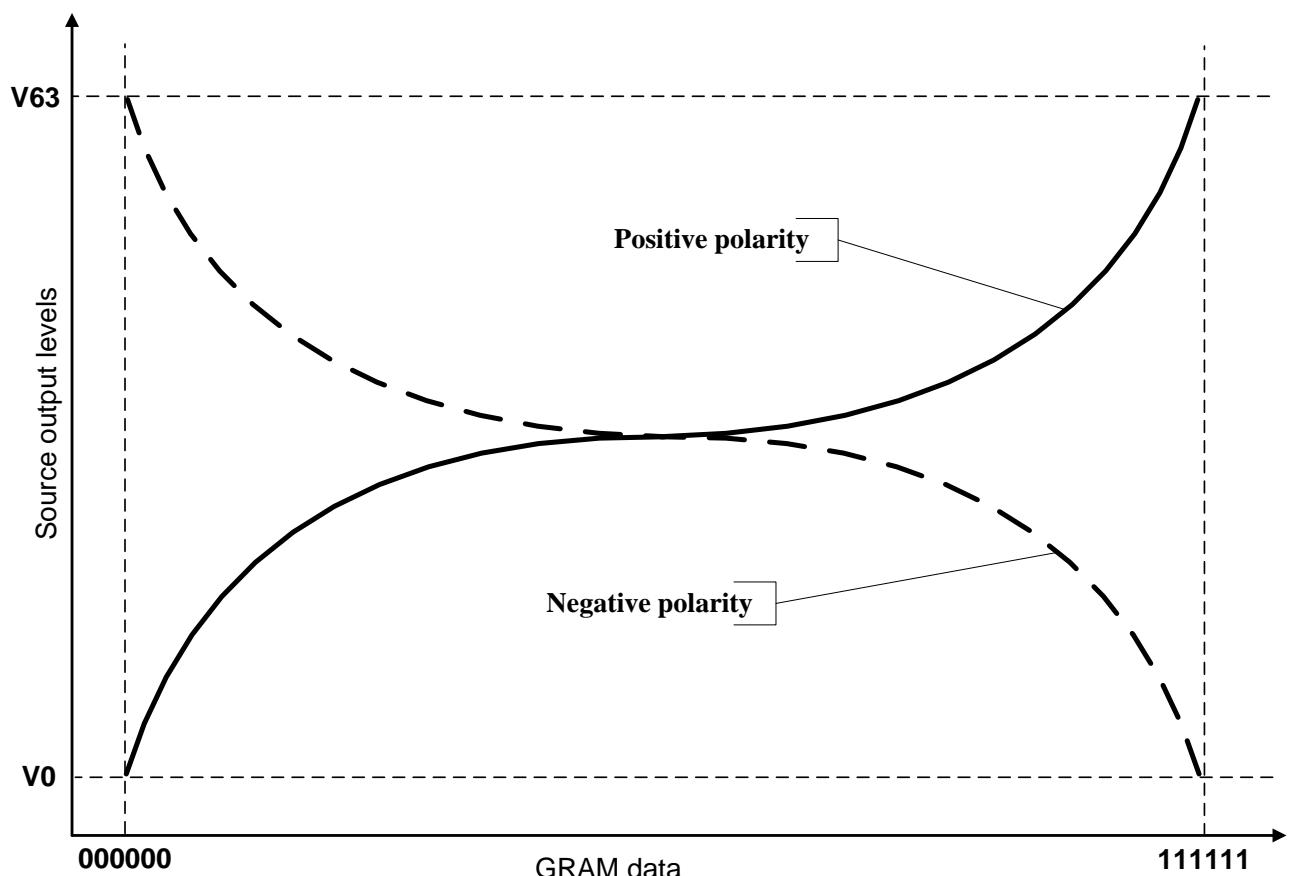

GC9107 incorporates the γ -correction function to display 262,144 colors for the LCD panel. The γ -correction is performed with 32 registers determining 16 reference grayscale levels, which make GC9107 available with liquid crystal panels of various characteristics.

Grayscale Voltage Generation

Relationship between Source Output and VCOM

5.9. Power Level Definition

5.9.1. Power Levels

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

In this mode, part of the display is used but with 8 colors.

5. Sleep In Mode.

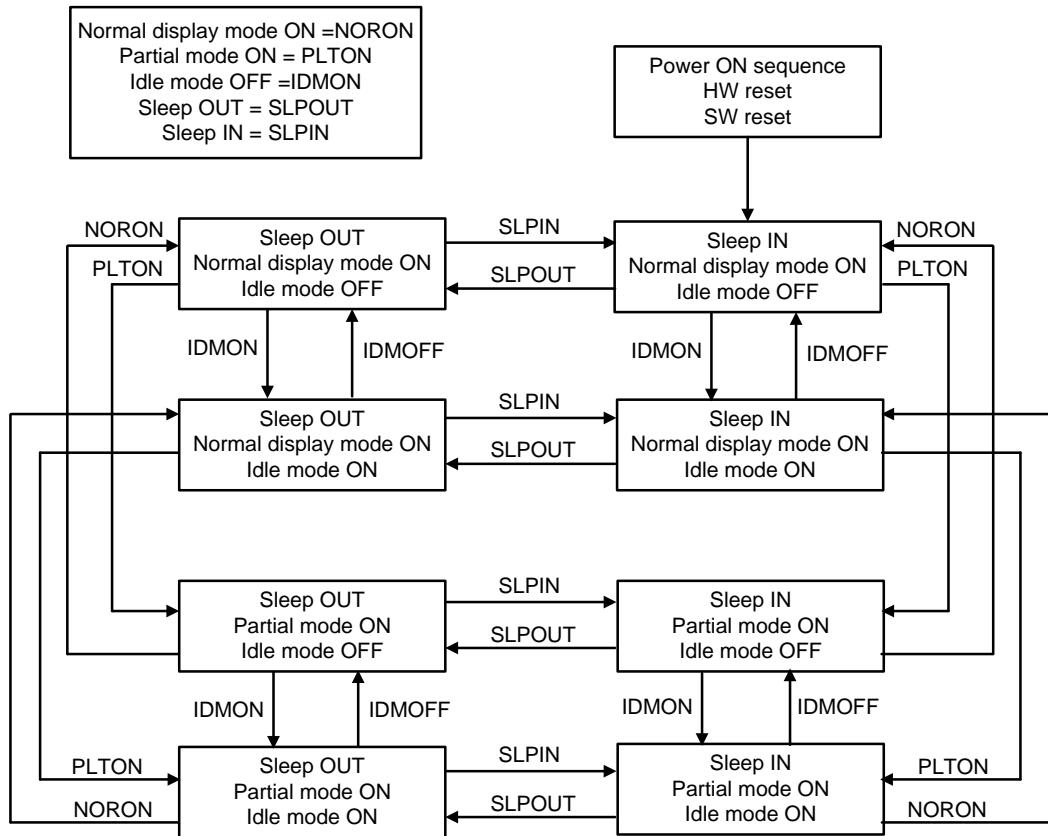

In this mode, the DC : DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

6. Power Off Mode.

In this mode, both VDD and VDDI are removed.

Note1: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

5.9.2. Power Flow Chart

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by User, when there is changing from one power mode to another power mode.

6. Command

6.2. Description of User Command

6.2.1. Read Manufactory Programming Identification (04h)

04h																								
	D/CX	RDX	WRX	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	0	1	↑	0	0	0	0	0	1	0	0	04												
1 st Parameter	1	↑	1	X	X	X	X	X	X	X	X	X												
2 nd Parameter	1	↑	1	Man_ID1_1 [7:0]								00												
3 rd Parameter	1	↑	1	Man_ID1_2 [7:0]								91												
4 th Parameter	1	↑	1	Man_ID1_3[7:0]								07												
Description	This read byte returns 24 bits display identification information. The 1st parameter is dummy data. The 2nd parameter (Man_ID1_1 [7:0]): LCD module's manufacturer ID. The 3rd parameter (Man_ID1_2 [7:0]): LCD module's manufacturer ID. The 4th parameter (Man_ID1_3 [7:0]): LCD module's manufacturer ID.																							
Restriction	The value of 04h is changed by OTP writing if OTP enable. When the OTP disable, the value of 04h is 0x009107. When the OTP enable, the value of 04h is the same as the OTP writing.																							
Register Availability	<table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>												Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

:	1	1	↑	Dx [17:0]								XX												
N th Parameter	1	1	↑	Dn [17:0]								XX												
Description	This command is used to transfer data from MCU to frame memory. This command makes no change to the other driver status. When this command is accepted, the column register and the page register are reset to the Start Column/Start Page positions. The Start Column/Start Page positions are different in accordance with MADCTL setting.) Then D [17:0] is stored in frame memory and the column register and the page register incremented. Sending any other command can stop frame Write. X = Don't care.

1 st Parameter	1	1	↑	00									00									
2 nd Parameter	1	1	↑	SSA [7:0]									00									
Description	<p>This command is used together with Vertical Scrolling Definition (33h). These two commands describe the scrolling area and the scrolling mode. The Vertical Scrolling Start Address command has one parameter which describes the address of the line in the Frame Memory that will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below:</p> <p>When MADCTL B4=0</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 160 and SSA='3'.</p>																					
Description	 <p>When MADCTL B4=1</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 160 and SSA='3'.</p>  <p>Note: (1) When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect. SSA refers to the Frame Memory line Pointer. (2) This command is ignored when the GC9107 enters Partial mode. X = Don't care</p>																					
Restriction	This command has no effect when Tearing Effect output is already ON

GC9107 Datasheet

Register Availability	Status	Availability
	Normal Mode On, Idle Mode Off, Sleep Out	Yes
	Normal Mode On, Idle Mode On, Sleep Out	Yes
	Partial Mode On, Idle Mode Off, Sleep Out	Yes
	Partial Mode On, Idle Mode On, Sleep Out	Yes
	Sleep In	Yes

7. Application

7.1. APPLICATION CIRCUIT

8. Electrical Characteristics

8.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When GC9107 is used out of the absolute maximum ratings, GC9107 may be permanently damaged. To use GC9107 within the following electrical characteristics limitation is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, GC9107 will malfunction and cause poor reliability.

Item	Symbol	Unit	Value
Supply voltage	VCI	V	-0.3~+4.6
Supply voltage(Logic)	IOVCC	V	-0.3~+4.6
Digital Operating voltage	VCORE	V	-0.3~+2.0
Driver supply voltage	VGH-VGL	V	17.5~+28.0
Logic input voltage range	VIN	V	-0.3~VDDI+0.3
Logic output voltage range	VO	V	-0.3~VDDI+0.3
Operation temperature	Topr	°C	-40~+80
Storage temperature	Tstg	°C	-55~+110

Note: If the absolute maximum rating of even is one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

8.2. Power ON/OFF Sequence

IOVCC and VCI can be applied in any order.

VCI and IOVCC can be power down in any order.

During power off, if LCD is in the Sleep Out mode, VCI and IOVCC must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, IOVCC or VCI can be powered down minimum 0msec after RESX has been released.

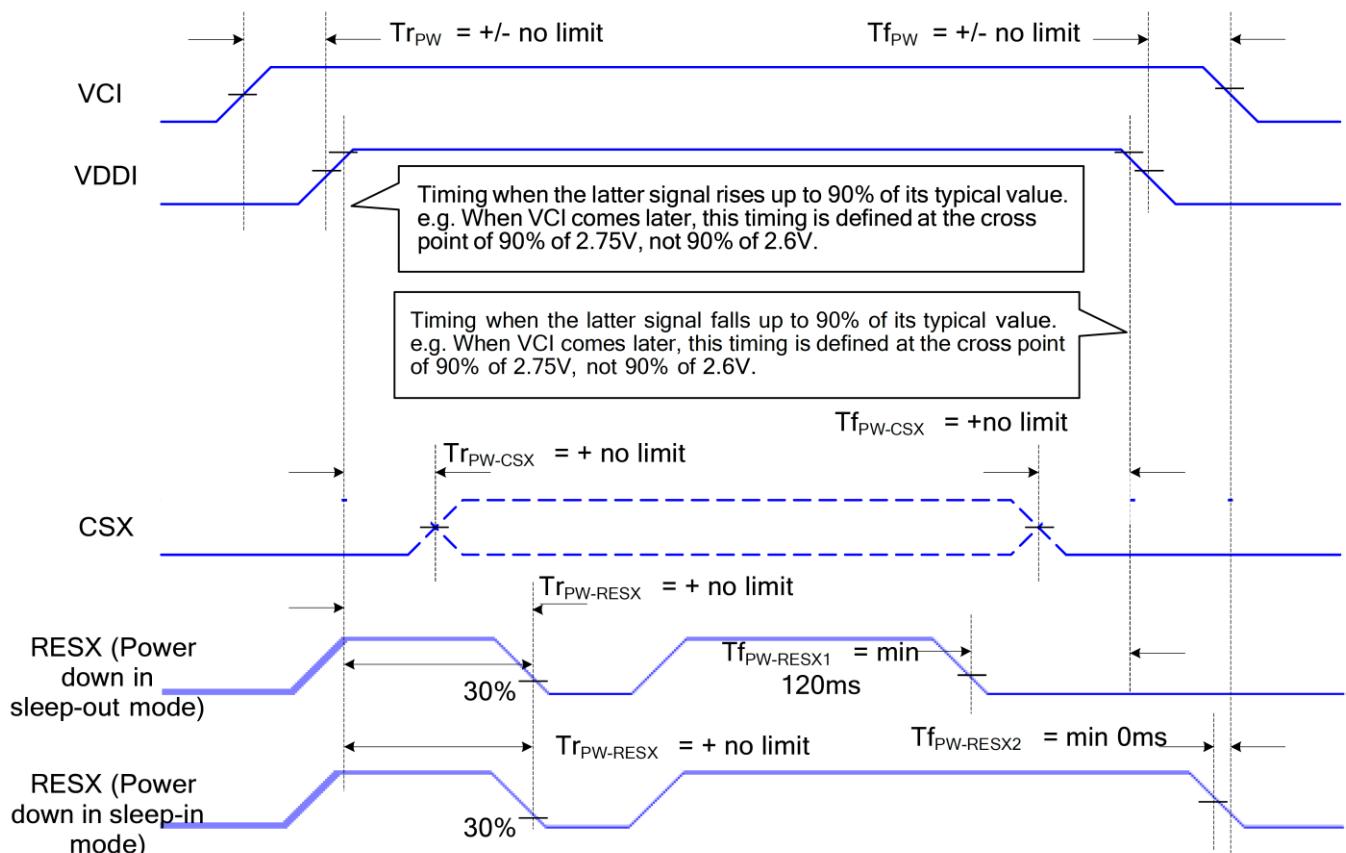

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

Note 1: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

Note 2: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

Note 3: If RESX line is not held stable by host during Power On Sequence as defined in the sequence below, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

The power on/off sequence is illustrated below

8.3. DC Characteristics

General DC Characteristics

Item	Symbol	Unit	Condition	Min.	Typ.	Max.	Note
Power and Operation Voltage							
Analog Operating Voltage	VCI	V	Operating voltage	2.5	2.8	3.3	Note2
Logic Operating Voltage	IOVCC	V	I/O supply voltage	1.65	2.8	3.3	Note2
Digital Operating voltage	VCORE	V	Digital supply voltage	-	1.8	-	Note2
Gate Driver High Voltage	VGH	V	-	10.0	-	15.0	Note3
Gate Driver Low Voltage	VGL	V	-	-13.0	-	-7.5	Note3
Driver Supply Voltage	-	V	VGH-VGL	17.5	-	28.0	Note3
Input and Output							
Logic High Level Input Voltage	VIH	V	-	0.7*VD DI	-	VDDI	Note1,2,3
Logic Low Level Input Voltage	VIL	V	-	VSS	-	0.3*V DDI	Note1,2,3
Logic High Level Output Voltage	VOH	V	IOL=-1.0mA	0.8*VD DI	-	VDDI	Note1,2,3
Logic Low Level Output Voltage	VOL	V	IOL=1.0mA	VSSR	-	0.2*V DDI	Note1,2,3
Logic High Level Input Current	IIH	uA	-	-	-	1	Note1,2,3
Logic Low Level Input Current	IIL	uA	-	-1	-	-	Note1,2,3
Logic Input Leakage Current	ILEA	uA	VIN=VDDI or VSSR	-0.1	-	+0.1	Note1,2,3
Source Driver							
Gamma Reference Voltage	VREG	V	-	2.92	-	5.19	-

Note 1: $VDDI=1.65$ to $3.3V$, $VDD=2.5$ to $3.3V$, $VSSA=VSSR=0V$, $Ta=-30$ to 70 (to $+85$ no damage) $^{\circ}C$

Note2: Please supply digital VDDI voltage equal or less than analog VDD voltage.

Note3 When the measurements are performed with LCD module. Measurement Points are like Note3.

Note4 $VDD=2.6V$

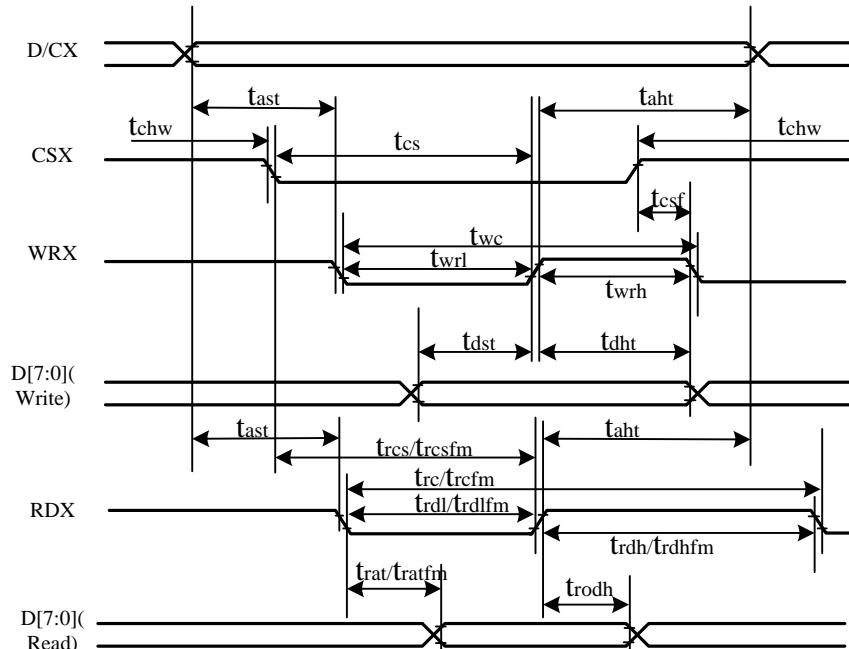

GC9107 Datasheet

Note5 VDD=3.3V

Note6 The Max. Value is between with Note 4 measure point and Gamma setting value

8.4. AC Characteristics

8.4.1. Display Parallel 8-bit Interface Timing Characteristics (8080)

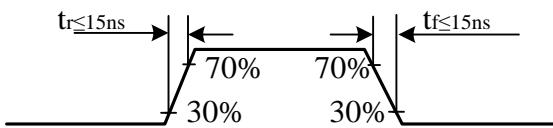

Signal	Symbol	Parameter	min	max	Unit	Description
DCX	t _{ast}	Address setup time	0	-	ns	
	t _{aht}	Address hold time(Write/Read)	0	-	ns	
CSX	t _{chw}	CSX "H" pulse width	0	-	ns	
	t _{cst}	Chip Select setup time(Write)	15	-	ns	
	t _{rcs}	Chip Select setup time(Read ID)	45	-	ns	
	t _{trcsfm}	Chip Select setup time(Read FM)	355	-	ns	
	t _{tcsf}	Chip Select Wait time (Write/Read)	10	-	ns	
WRX	t _{wc}	Write Cycle	34	-	ns	
	t _{twrh}	Write Control pulse H duration	17	-	ns	
	t _{twrl}	Write Control pulse L duration	17	-	ns	
RDX(FM)	t _{trcfm}	Read Cycle (FM)	450	-	ns	
	t _{trdlfm}	Read Control H duration(FM)	90	-	ns	
	t _{trdhfm}	Read Control L duration(FM)	355	-	ns	

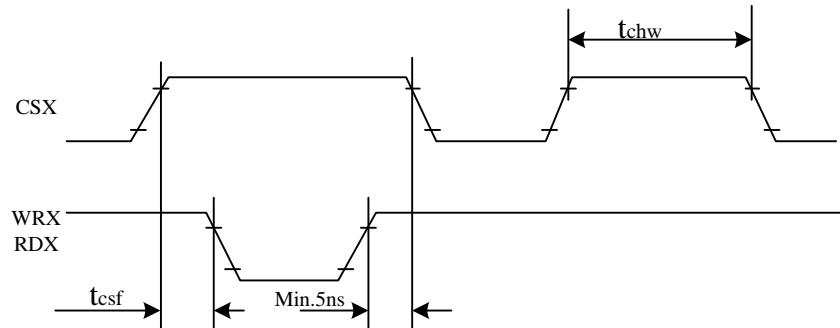

GC9107 Datasheet

RDX(ID)	trc	Read Cycle (ID)	160	-	ns	
	trdh	Read Control H pulse duration	90	-	ns	
	trdl	Read Control L pulse duration	45	-	ns	
D[7:0]	tdst	Write data setup time	10	-	ns	For maximum CL=30pF
	tdht	Write data hold time	10	-	ns	
	trat	Read access time	-	40	ns	For minimum CL=8pF
	tratfm	Read access time	-	340	ns	
	trod	Read output disable time	20	80	ns	

Note: $T_a = -30$ to 70 °C, $VDDI=1.65V$ to $3.3V$, $VDD=2.5V$ to $3.3V$, $VSSR=0V$

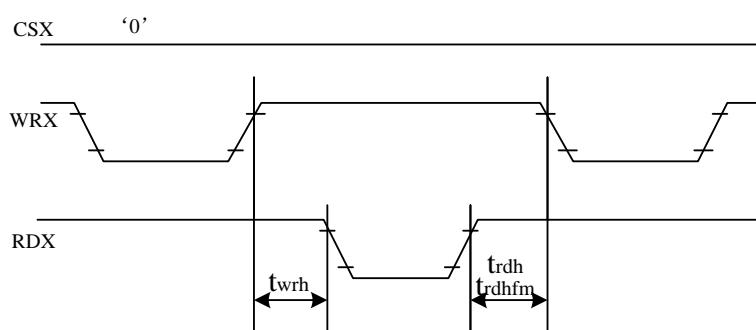

CSX timings :

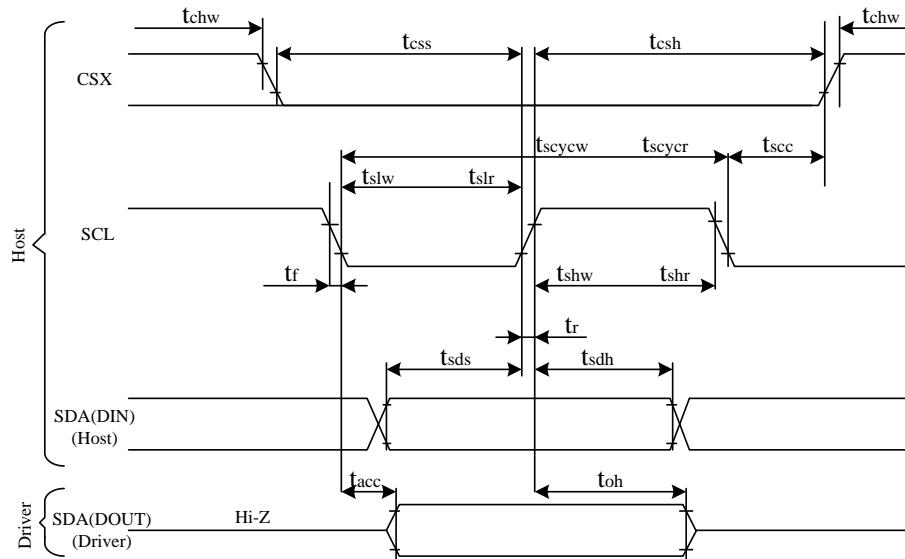

Note: Logic high and low levels are specified as 30% and 70% of VDDI for Input signals.

Write to read or read to write timings:

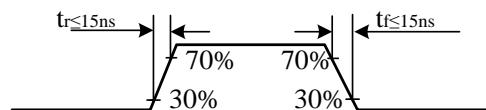

Note: Logic high and low levels are specified as 30% and 70% of VDDI for Input signals.

8.4.2. Display Serial Interface Timing Characteristics (3-line SPI system)

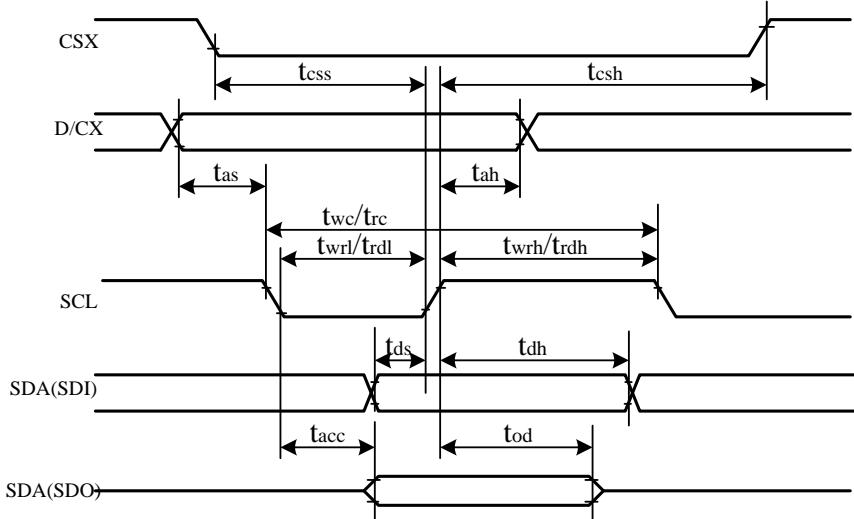

Signal	Symbol	Parameter	min	max	Unit	Description
SCL	tscycw	Serial Clock Cycle (Write)	10	-	ns	
	tshw	SCL "H" Pulse Width (Write)	5	-	ns	
	tslw	SCL "L" Pulse Width (Write)	5	-	ns	
	tscycr	Serial Clock Cycle (Read)	150	-	ns	
	tshr	SCL "H" Pulse Width (Read)	60	-	ns	
	tslr	SCL "L" Pulse Width (Read)	60	-	ns	
SDA/SDI (Input)	tsds	Data setup time (Write)	5	-	ns	
	tsdh	Data hold time (Write)	5	-	ns	
SDA/SDO (Output)	tacc	Access time (Read)	10	-	ns	
	toh	Output disable time (Read)	10	50	ns	
CSX	tscc	SCL-CSX	10	-	ns	
	tchw	CSX "H" Pulse Width	20	-	ns	
	tcss	CSX-SCL Time	40	-	ns	
	tcsch		10	-	ns	

Note: $T_a = 25^\circ C$, $VDDI=1.65V$ to $3.3V$, $VDD=2.5V$ to $3.3V$, $VSSA=VSSR=0V$

8.4.3. Display Serial Interface Timing Characteristics (4-line SPI system)

Signal	Symbol	Parameter	min	max	Unit	Description
CSX	tcss	Chip select time (Write)	20	-	ns	
	tcssh	Chip select hold time (Read)	40	-	ns	
SCL	twc	Serial Clock Cycle (Write)	10	-	ns	
	twrh	SCL "H" Pulse Width (Write)	5	-	ns	
	twrl	SCL "L" Pulse Width (Write)	5	-	ns	
	trc	Serial Clock Cycle (Read)	150	-	ns	
	trdh	SCL "H" Pulse Width (Read)	60	-	ns	
	trdl	SCL "L" Pulse Width (Read)	60	-	ns	
D/CX	tas	D/CX setup time	10	-	ns	
	tah	D/CX hold time (Write/Read)	10	-	ns	
SDA/SDI (Input)	tds	Data setup time (Write)	5	-	ns	
	tdh	Data hold time (Write)	5	-	ns	
SDA/SDO (Output)	tacc	Access time (Read)	10	-	ns	For maximum CL=30pF For minimum CL=8pF
	toh	Output disable time (Read)	20	50	ns	

Note: $T_a = 25^{\circ}\text{C}$, $VDDI=1.65\text{V}$ to 3.3V , $VDD=2.5\text{V}$ to 3.3V , $VSSA=VSSR=0\text{V}$
